EXECUTIVE SUMMARY

As requested by The District Midtown, Walter P Moore conducted a Traffic Impact Analysis for a multistory building with a mixed-use development. This development, which is scheduled to open in 2021, is located in Midtown Houston, between Main Street and Fannin Street, Drew Street and McGowen Street. Currently, the site consists of two city blocks divided by Dennis Street. The mixed-use development will consist of a health/fitness club, supermarket, hotel, general office building, park/events deck, apartments, and quality restaurant spaces. Dennis Street between Fannin Street and Main Street is proposed to be abandoned and incorporated into the site.

Study Area

Eight signalized and nine unsignalized intersections in the study area were analyzed as part of the Traffic Impact Analysis including:

1. Main at Webster (signalized)
2. Travis at McGowen (signalized)
3. Main at McGowen (signalized)
4. Fannin at McGowen (signalized)
5. Main at Dennis (unsignalized)
6. Fannin at Dennis (unsignalized)
7. Main at Drew (unsignalized)
8. Fannin at Drew (unsignalized)
9. Main at Tuam (unsignalized)
10. Fannin at Tuam (unsignalized)
11. Travis at Anita (unsignalized)
12. Main at Anita (unsignalized)
13. Fannin at Anita (unsignalized)
14. Travis at Elgin (signalized)
15. Elgin at Main (signalized)
16. Elgin at Fannin (signalized)
17. Main at Holman (signalized)

Analysis

Intersection operations were analyzed using VISSIM 9.0. Capacity analyses were performed for:

- Existing conditions (2017).
- Background conditions (2021) - which include a 1% annual growth rate and trips created by proposed developments by others.
- Proposed conditions (2021) - which include the background conditions plus site generated traffic for the all the proposed development.

Summary

By using the ITE Trip Generation Handbook, it was estimated that the total number of trips generated by the development will be 492 trips in the AM peak hour, and 632 trips in the PM peak hour. These trips will access the development using the two main driveways located along Fannin

Street. A third driveway will serve as a loading dock area. The VISSIM simulation shows that the anticipated traffic generated by the development will not decrease the LOS at the analyzed intersections in this study.

Fannin Street, where all of the proposed driveways of the development will be located, has enough capacity to handle the additional generated traffic. The removal of Dennis Street due to the proposed development, does not have a significant impact to the traffic in the area. Traffic volumes for both AM and PM peak hours are low (15 vehicles for the AM peak and 16 vehicles for the PM peak), and the adjacent Drew Street and McGowen Street were able to accommodate the rerouted traffic.

Based on the traffic capacity analysis, the District-Midtown development is not anticipated to have major impact on the surrounding intersections analyzed in this report.

INTRODUCTION

As requested by The District Midtown, Walter P Moore conducted a Traffic Impact Analysis for a multistory building with a mixed-use development. The District-Midtown development, which is scheduled to open in 2021, is located in Midtown Houston, between Main Street and Fannin Street, and Drew Street and McGowen Street. Currently, the site consists of two city blocks divided by Dennis Street; the existing property consists of an art supply store and surface parking areas. The proposed mixed-use development will consist of a health/fitness club, supermarket, hotel, general office building, park/events deck, apartments, and quality restaurant spaces.

The purpose of this study is to determine potential impact to traffic operations in the area surrounding the proposed development.

EXISTING CONDITIONS

The proposed development is located approximately half a mile southwest of downtown Houston. The study area is bounded by Main Street to the east, Fannin Street to the west, Drew Street to the south and McGowen Street to the north. An existing site location map showing the general location of the proposed District Midtown development is provided in **Figure 1**.

SITE

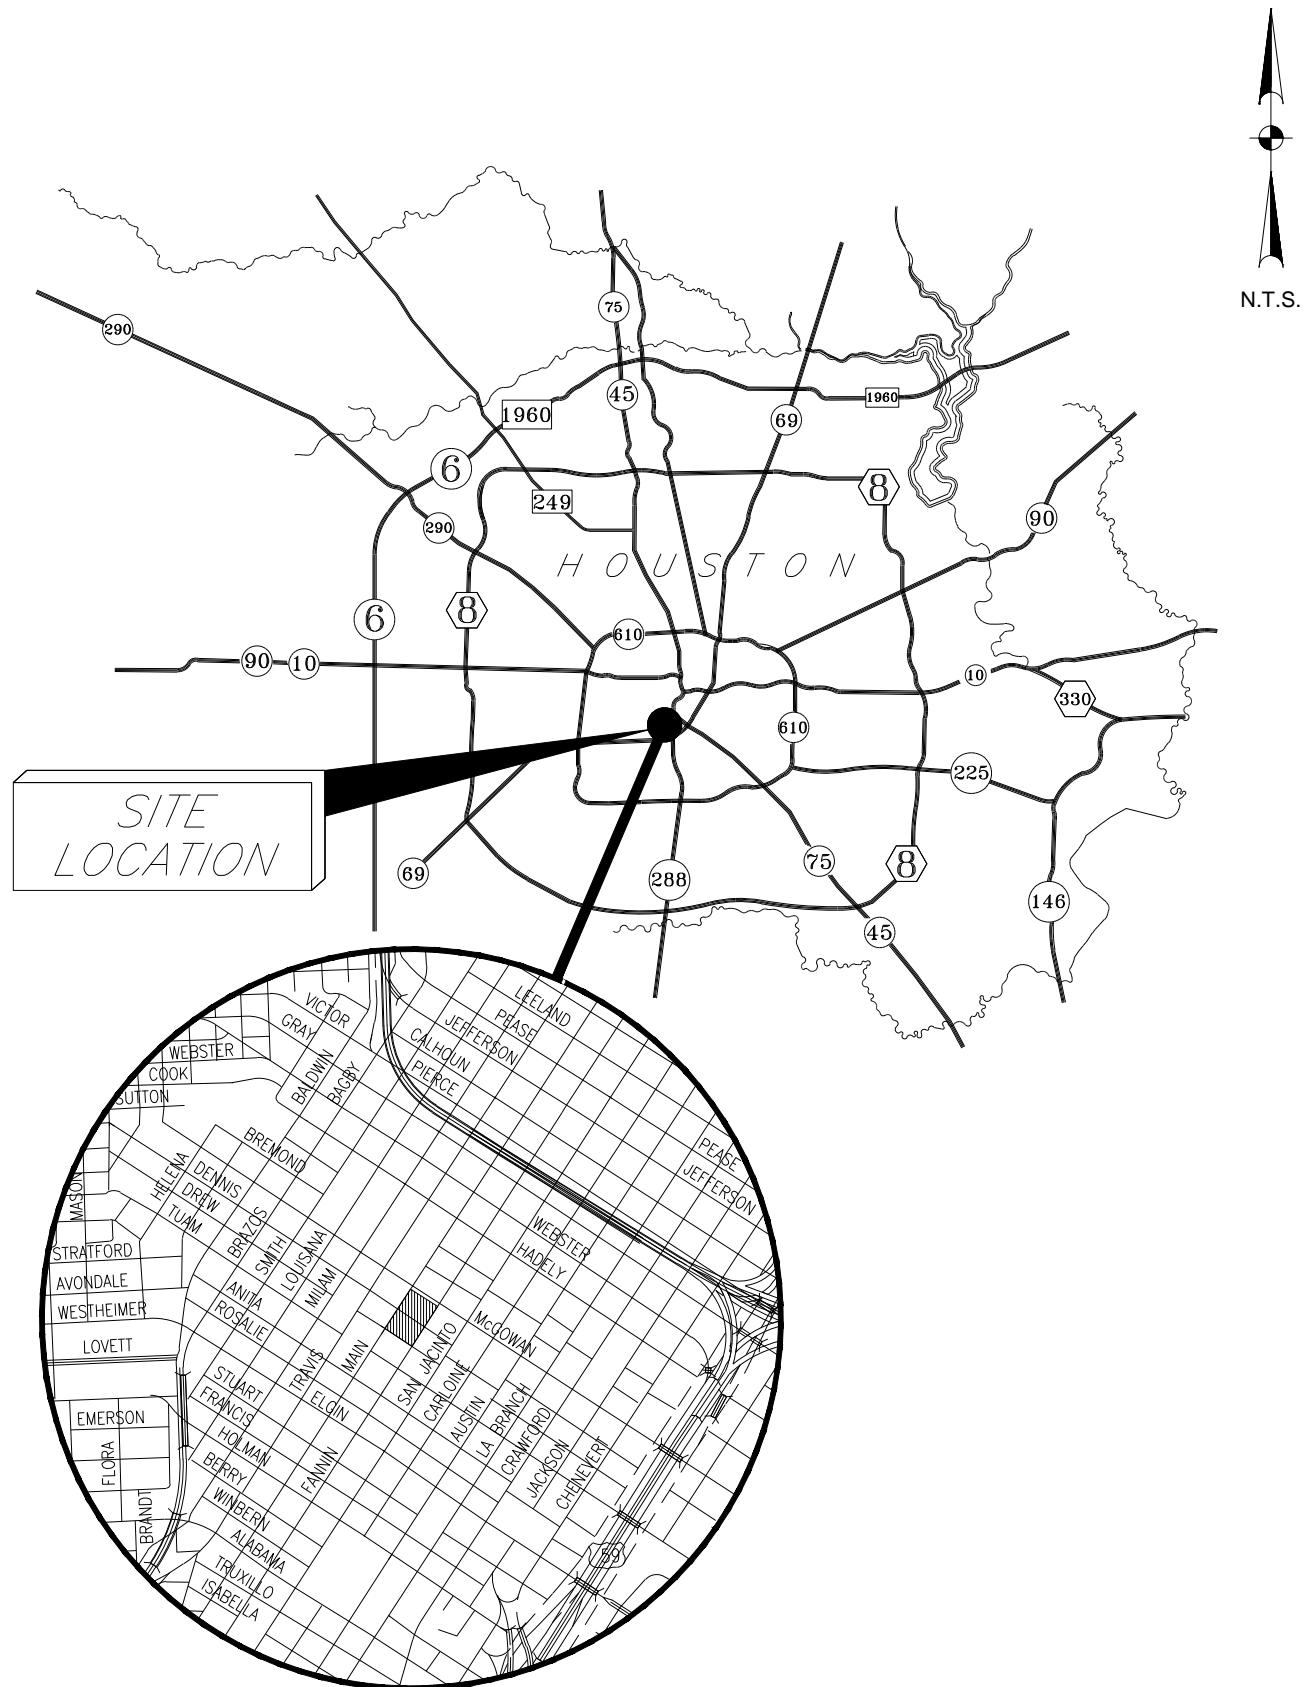

The existing property consists of two blocks separated by Dennis Street. The block south of Dennis Street consists of a two story 31,408 square feet art supply store.

The block located north of Dennis Street contains a surface parking area and four independent buildings along McGowen Street. These buildings are external to the development and will remain in place, as shown in **Figure 1.1**.

N.T.S.

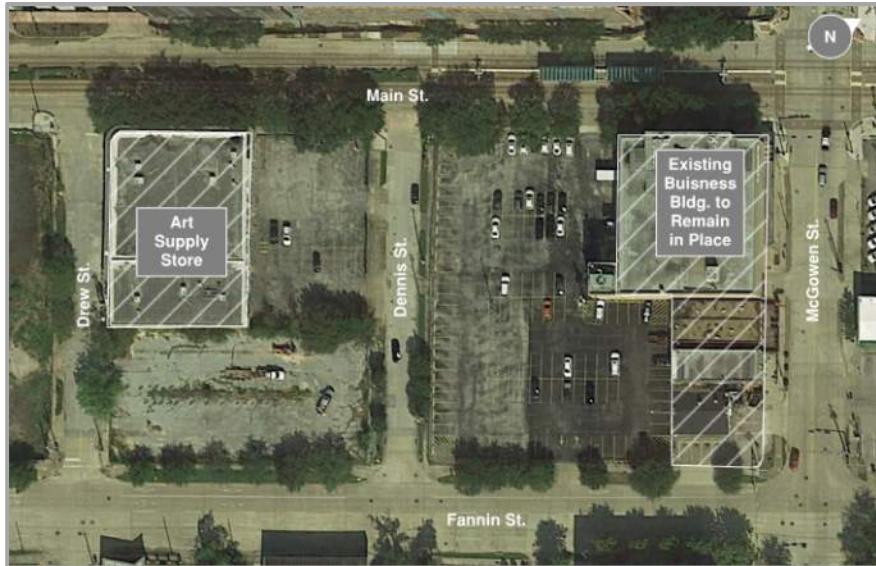

Figure 1.1 Existing Site

ROADWAYS

The primary roadways in the area are described in the following paragraphs.

Main Street runs north-south with one through lane in the study area. Left turns on Main Street are prohibited and the Houston Metro Red Line Light Rail Train (LRT) runs north and south along the inner lanes of Main Street. The posted speed limit on this Street in the study area is 30 mph.

Fannin Street runs southbound and it has five lanes in the study area with two lanes designated as HOV lanes. In the study area, Fannin Street is considered a major thoroughfare. The posted speed limit on Fannin Street in the study area is 30 mph.

McGowen Street runs east-west and it has one lane in each direction in the study area. Metered on-street parking is observed on McGowen. In the study area, McGowen Street is considered a major collector street. The posted speed limit on McGowen Street in the study area is 30 mph.

Dennis Street runs east-west and it has one lane in each direction. Metered on-street parking is present on Dennis. The posted speed limit on Dennis Street in the study area is 30 mph.

Drew Street runs east-west and it has one lane in each direction. Metered on-street parking is present on Dennis. The posted speed limit on Dennis Street in the study area is 30 mph.

Tuam Street runs east-west and it has one lane in each direction. Metered on-street parking is present on Tuam. The posted speed limit on Tuam Street in the study area is 30 mph.

Anita Street runs east-west and it has one lane in each direction. Metered on-street parking is present on Tuam. The posted speed limit on Tuam Street in the study area is 30 mph.

Elgin Street runs east-west and has two lanes in each direction in the study area. Parking is not permitted on Elgin Street in the study area. In the study area, Elgin Street is considered a major thoroughfare. The posted speed limit on Elgin Street in the study area is 30 mph.

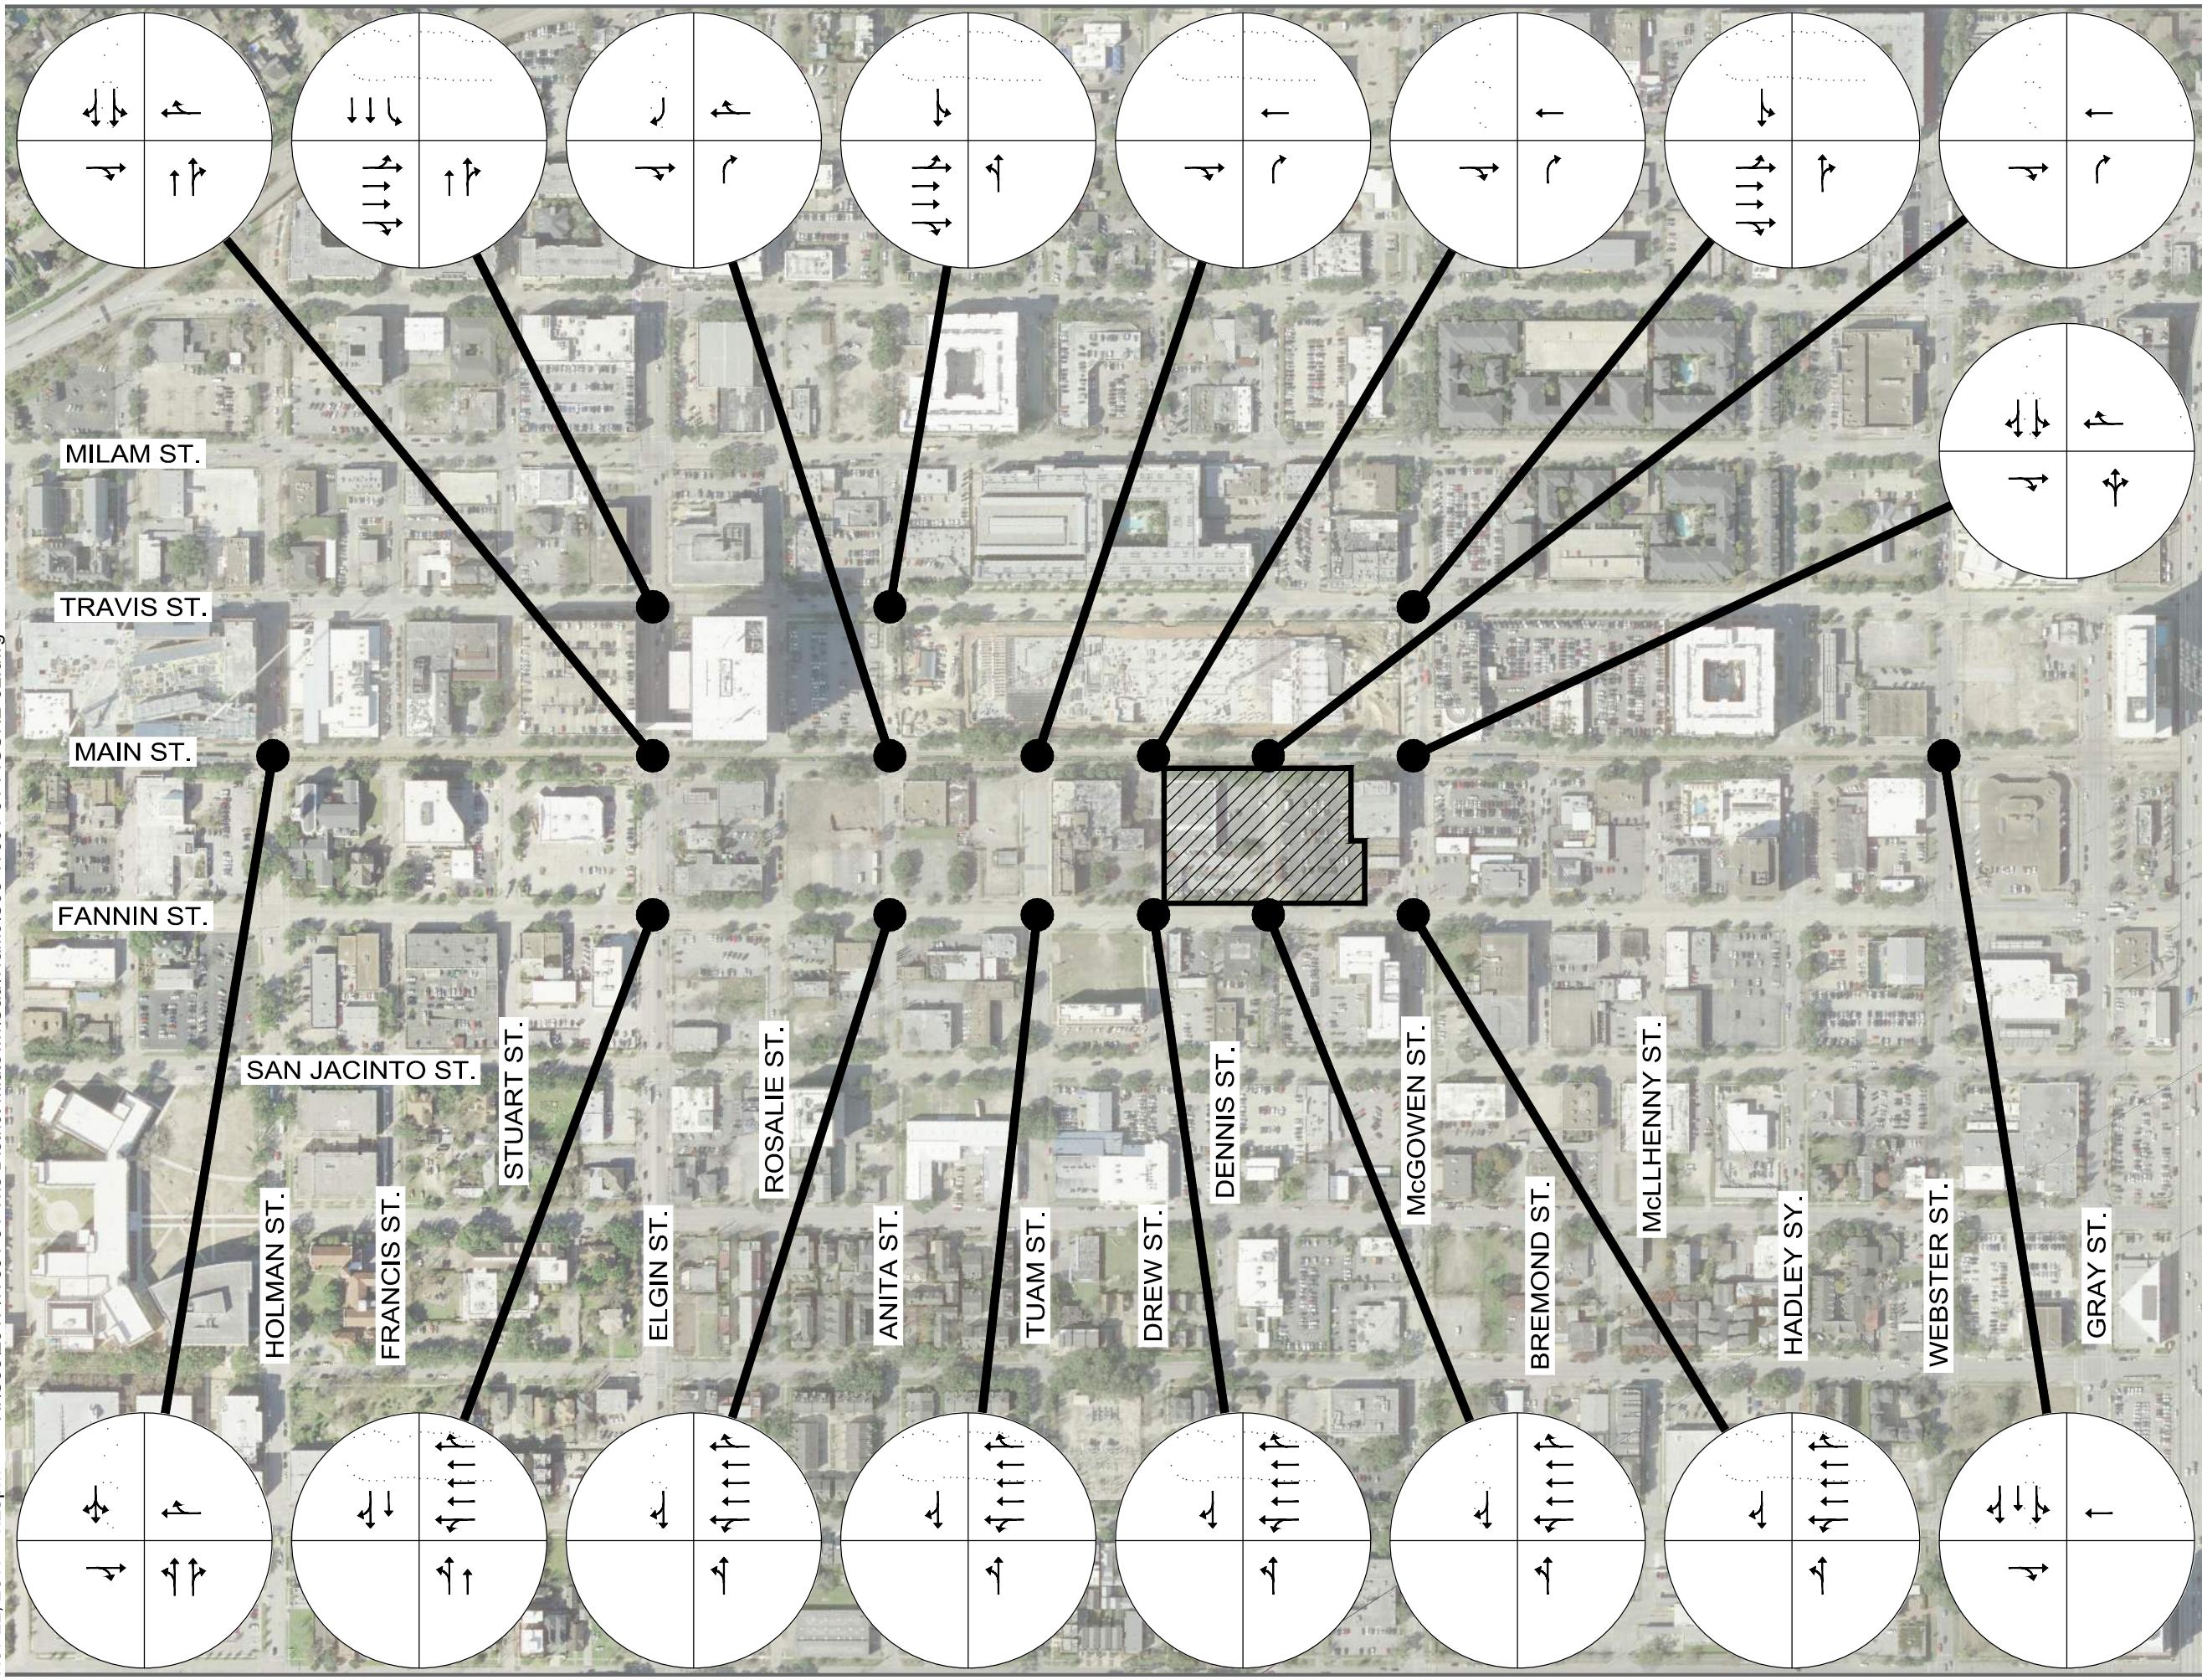

INTERSECTIONS

As determined in a City of Houston scoping meeting, on October 16, 2017, the following intersections were determined to be analyzed in this traffic impact analysis. Intersection and existing lane configurations can be seen in **Figure 2**.

- | | |
|-------------------------------------|------------------------------------|
| 18. Main at Webster (signalized) | 27. Fannin at Tuam (unsignalized) |
| 19. Travis at McGowen (signalized) | 28. Travis at Anita (unsignalized) |
| 20. Main at McGowen (signalized) | 29. Main at Anita (unsignalized) |

| 24. Main at Drew (unsignalized) | 33. Elgin at Fannin (signalized) |
| 25. Fannin at Drew (unsignalized) | 34. Main at Holman (signalized) |
| 26. Main at Tuam (unsignalized) | |

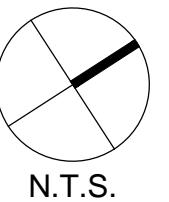

VOLUMES

Turning movement counts were collected at the study intersections on Tuesday, April 26, and on Tuesday, May 11, 2017, from 7:00-9:00 AM and from 4:00-6:00 PM. **Figures 3** and **Figure 4** illustrate the existing area AM peak hour (8:00 AM – 9:00 AM) and PM Peak hour (5:00 – 6:00 PM) volumes. Detailed existing traffic volumes can be found under **TAB ONE**.

PLANNED DEVELOPMENT

SITE DEVELOPMENT

The development will consist of two towers located within two city blocks; **Figure 5** shows the proposed full build project site plan layout. As seen in **Figure 5**, Dennis Street right-of-way, between the limits of Main Street and Fannin Street, is planned to be purchased in order to utilize the two adjacent city blocks for the development site. Dennis Street is a two-way, 24 feet wide, minor street that serves as the main access to the driveways of the existing surface parking.

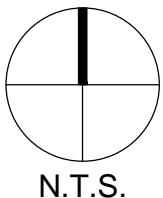

The proposed mixed-use development will include a health/fitness club, supermarket, hotel, general office building, park/events deck, apartments, and quality restaurant space. The list below reflects the size and type of development expected at the proposed site.

- Fitness Center (5,500 SF)
- Supermarket (19,697 SF)
- Hotel (195 rooms)
- Office (106,038 SF)
- Park/Events Deck (1.01 acre)
- Apartments (957 dwelling units)
- Quality Restaurants (65,754 SF)

DRIVEWAYS

Currently, the existing sites are driveways along Dennis Street, Drew Street, and McGowen Street. Dennis Street is proposed to be removed, between Main Street and Fannin Street, in order to accommodate the proposed development. The only proposed access to the development will be provided along Fannin Street. A set of three entry and exit points located along Fannin Street will provide access to the development.

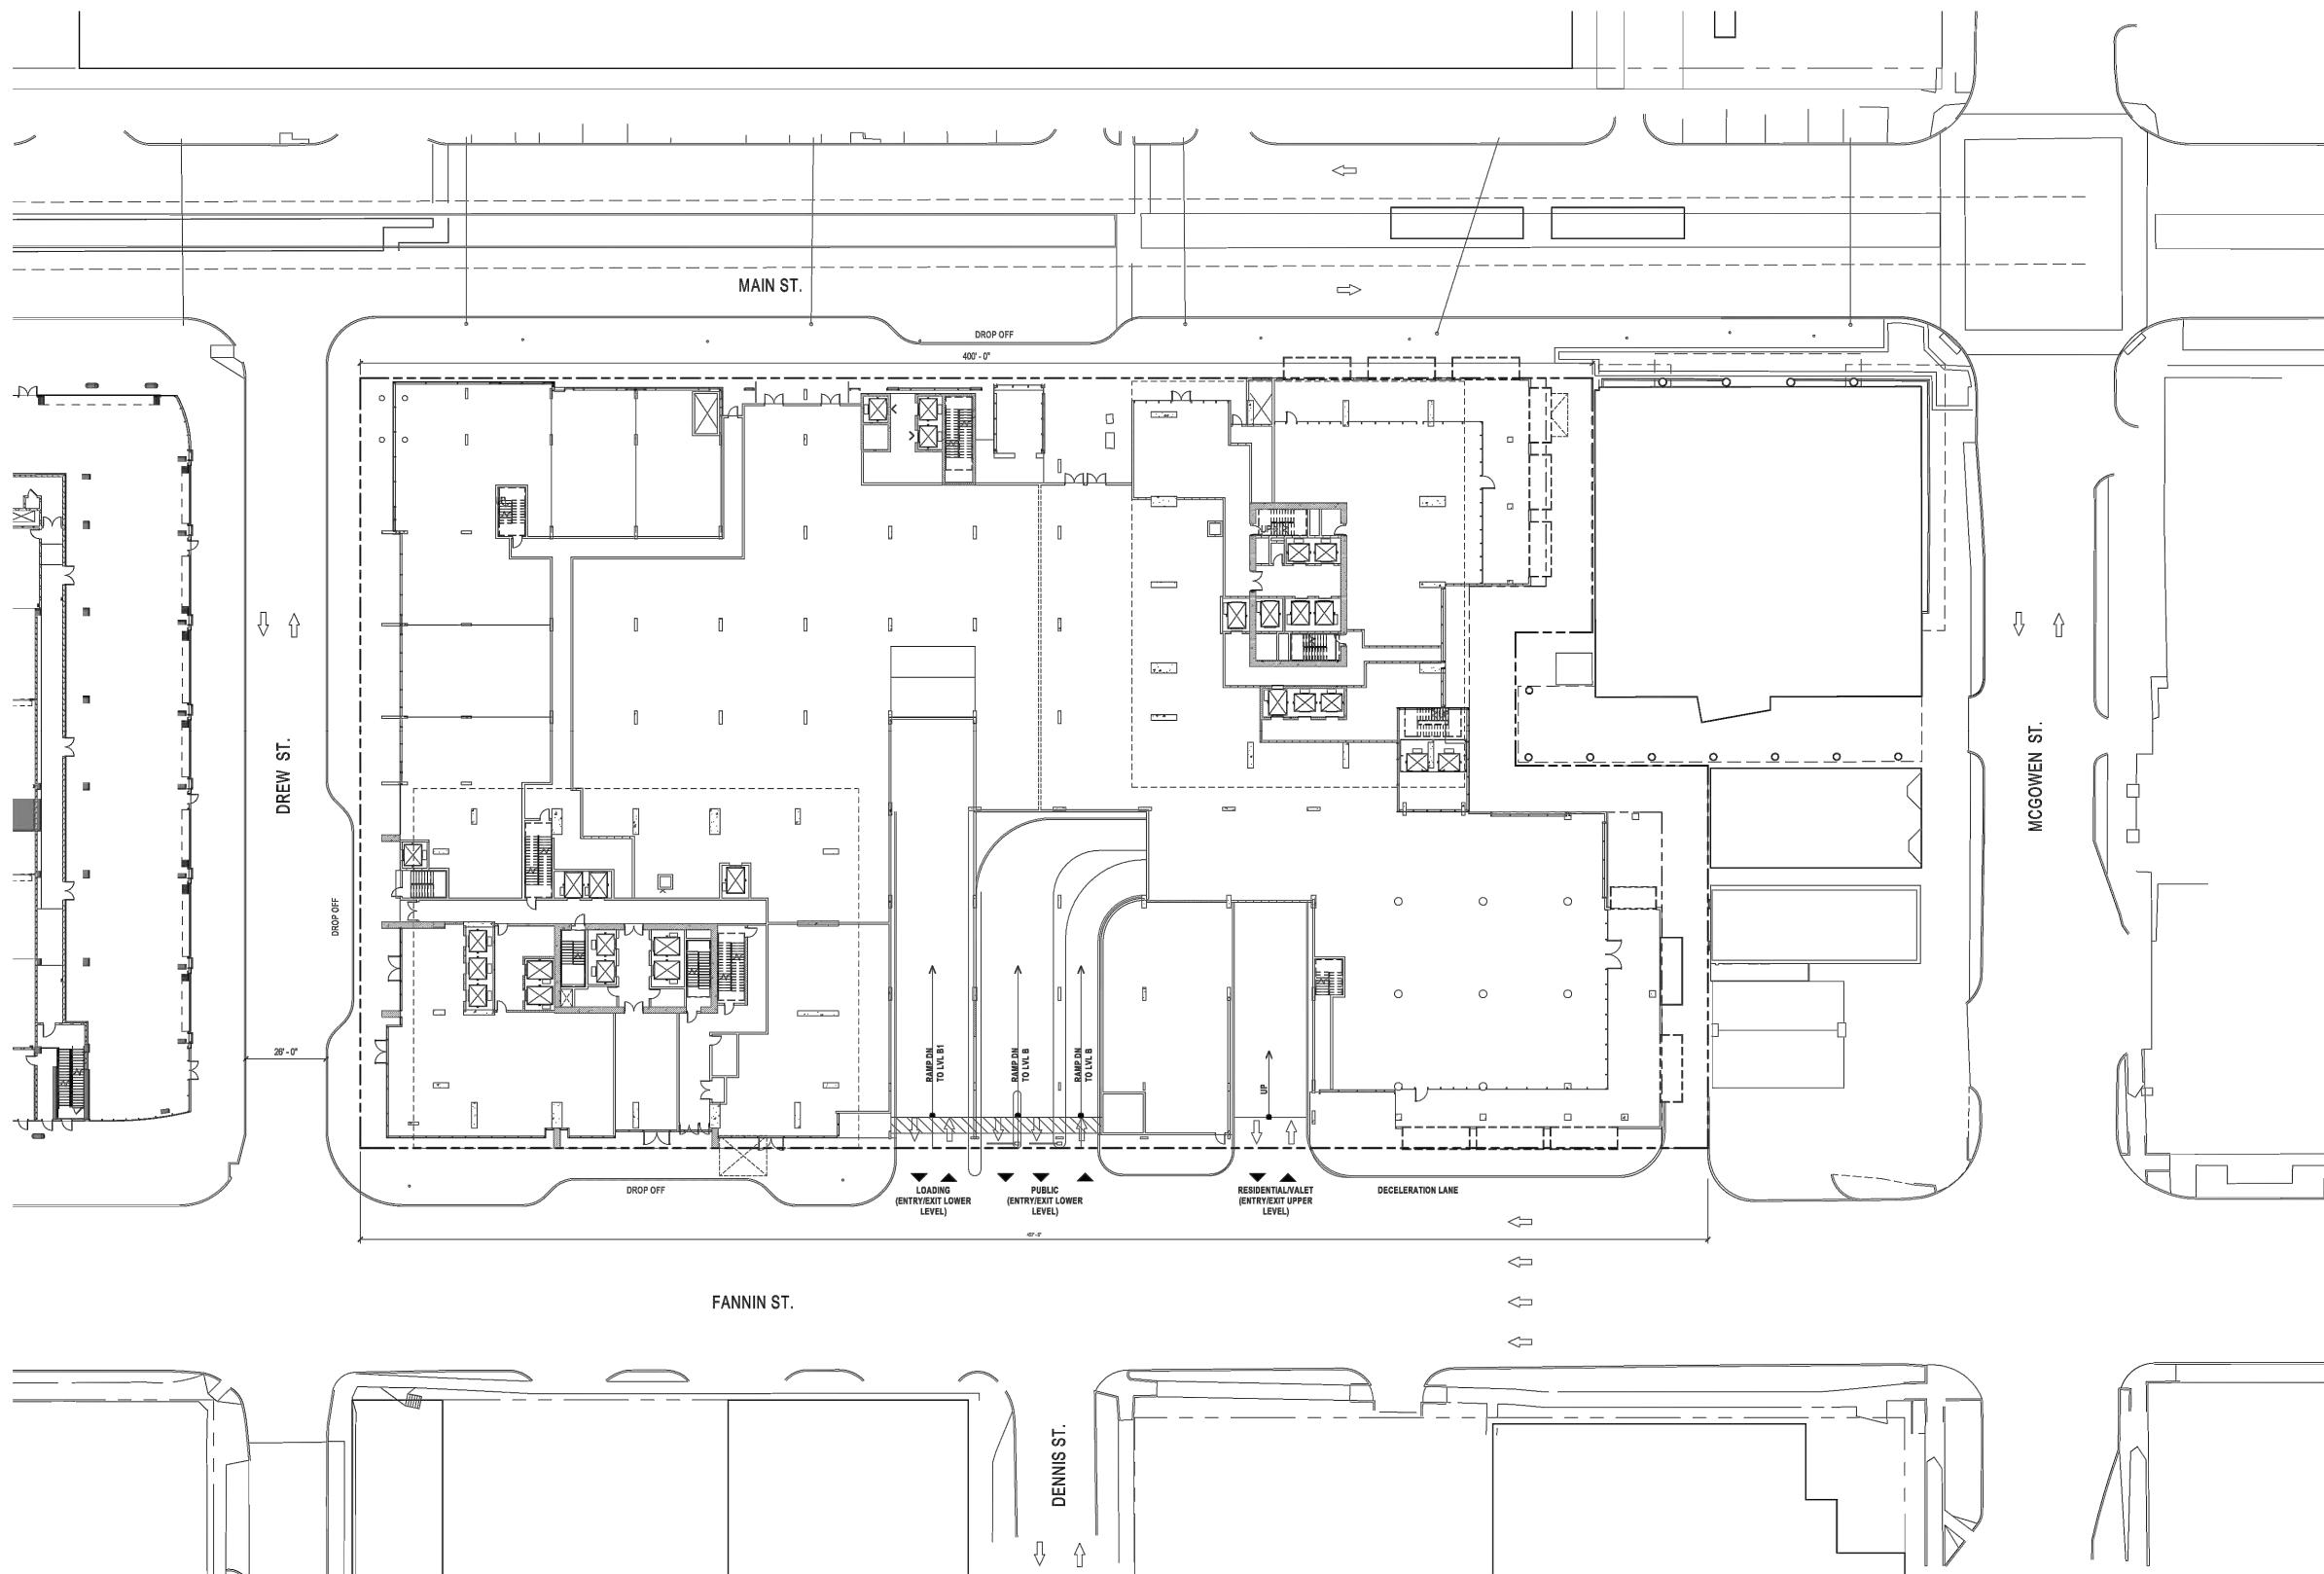

The first access point (Driveway A), will be dedicated to the loading dock parking area and will be used by delivery and service trucks; the second access point (Driveway B) will serve as a main general parking lot; and the third access point (Driveway C) will be dedicated for residents and valet parking. The development driveway will be located south of McGowen Street. The development will also have three drop-off lanes, one on each of the surrounding streets of Main Street, Drew Street and Fannin Street. The anticipated proposed driveways and drop-off areas are listed in **Table 1** and locations can be seen in **Figure 6**.

Table 1: Proposed Driveways

No.	Type	Access From	Access To
Driveway A	Right in, right out	Fannin Street	Loading Dock Area
Driveway B	Right in, right out	Fannin Street	Public
Driveway C	Right in, right out	Fannin Street	Residents and Valet Parking

The three proposed driveways along Fannin Street will also meet the minimum driveway placement criteria. The driveway will be located south of McGowen Street at 220, 290, and 328 feet. These proposed driveways met the minimum placement criteria distance required of 100 feet, offset from the primary street as per the City of Houston's Infrastructure Design Manual Guidelines - Chapter 15, table 15.08.03.

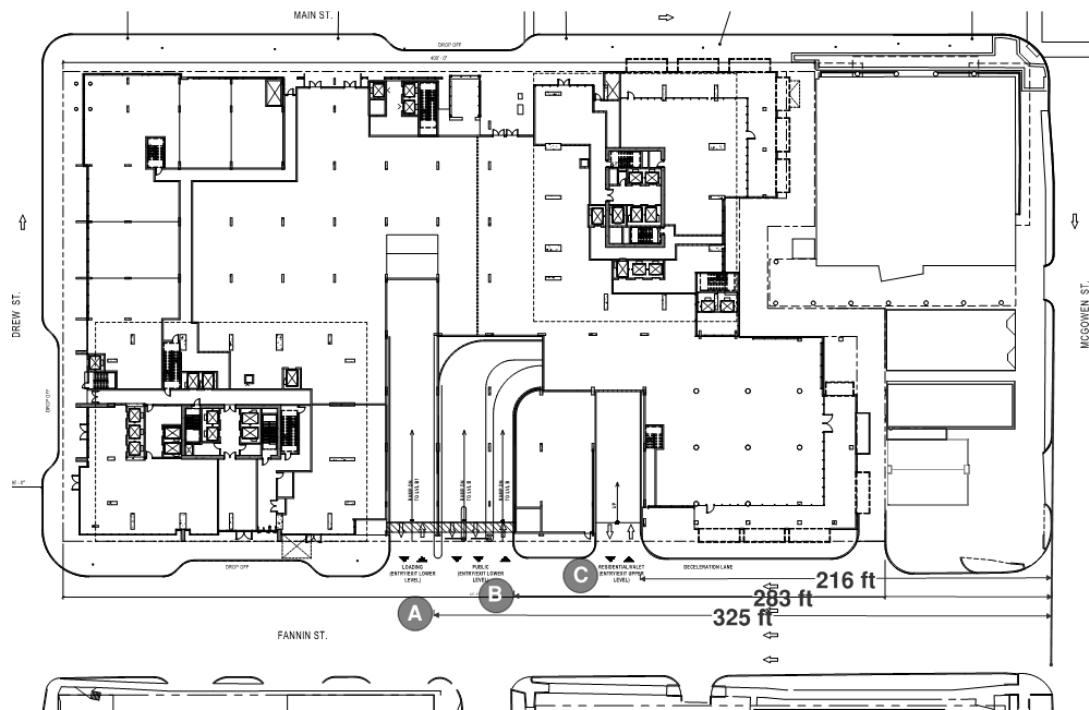

Figure 6: Proposed Driveways and Drop-Off Areas

PROJECTED CONDITIONS

TRIP GENERATION

Standard rates from the Institute of Transportation Engineers (ITE) publication, *Trip Generation, 9th edition*, were used to determine the expected traffic generated by the development. Trips

generated by the development during an average weekday and peak hours, were based on the land use type and size of the building. This study also accounts for the number of trips which will be eliminated after the removal of the existing art supply store. This existing art supply store will not be relocated inside the new site development; therefore the trips from this site were calculated and removed from the adjacent street network.

In accordance with the City of Houston's Infrastructure Design Manual Guidelines - Chapter 15, the average rate and the regression equations were used to estimate the trips generated by the weekday, AM Peak Hour, and PM Peak Hour. The trip generation equations and average rates for the development and the directional distribution are presented in **Table 2**.

Table 2: ITE Trip Generation Equations and Average Rates

Land Use	Method	Weekday		AM Peak Hour		PM Peak Hour	
Health/Fitness Center (492)	Average	32.93		1.41		3.53	
	Directional Distribution	Enter	Exit	Enter	Exit	Enter	Exit

	Directional Distribution	Enter	Exit	Enter	Exit	Enter	Exit
		50%	50%	44%	56%	48%	52%

PASS-BY, INTERNAL CAPTURE AND TRANSIT TRIP REDUCTION

The development is considered to be a mixed-use development; therefore there will be numerous trips that will occur within the development. The following describes the trip reduction due to pass-by, internal capture, and transit operation.

PASS-BY TRIPS

Pass-by trips are made as intermediate stops on the way from an origin to a primary trip destination without a route diversion. This study accounts for these pass-by trips associated with the generated traffic from the supermarket and the quality restaurant. Based on the *ITE Trip Generation Handbook*, it was estimated that 57% of the total supermarket site generated trips, and 26% of the total quality restaurant site generated trips, will be pass-by trips.

INTERNAL CAPTURE TRIPS

In accordance with the discussion with the City of Houston staff representatives, it was also determined that internal capture trip reductions should be accounted for the following land uses:

- Health/fitness center
- Hotel
- General office building

The development for these land uses are projected to share some of the trips within the same proposed development. It is anticipated that the health/fitness center will have an internal capture rate of 90%; the hotel a 15% rate, and the office building a 15% rate.

TRANSIT TRIPS

The proposed development is also located next to a METRORail station; therefore a trip reduction factor was applied. Based on the Superblock Traffic Study performed near the District Midtown development, transit trip reduction was determined to be approximately 20%. In order to have a more conservative approach, a 15% transit trip reduction was chosen for the District Midtown development.

Table 3 shows a summary of the trips generated by the proposed development after pass-by, internal capture and transit trip reductions.

Table 4: Trip Generation Volumes

Existing/ Proposed	ITE Code	Trip Generation Land Use	Size	Unit	Method	Weekday			A.M. Peak			P.M. Peak

¹Information Provided by Caydon

TRIP DISTRIBUTION

After determining the number of trips generated by the proposed development, trips were distributed along the roadway network. The location of the proposed development, the roadway layout configuration, and the current travel patterns, were examined and used as a base to determine the available routes along the studied intersections. All traffic assignments were designated over the most reasonable routes for this mixed-used development.

These trip distributions were determined using the expected travel patterns from the trip generators. **Figure 7** and **8** illustrates the trip distribution for the proposed developments for the AM and PM peak hours.

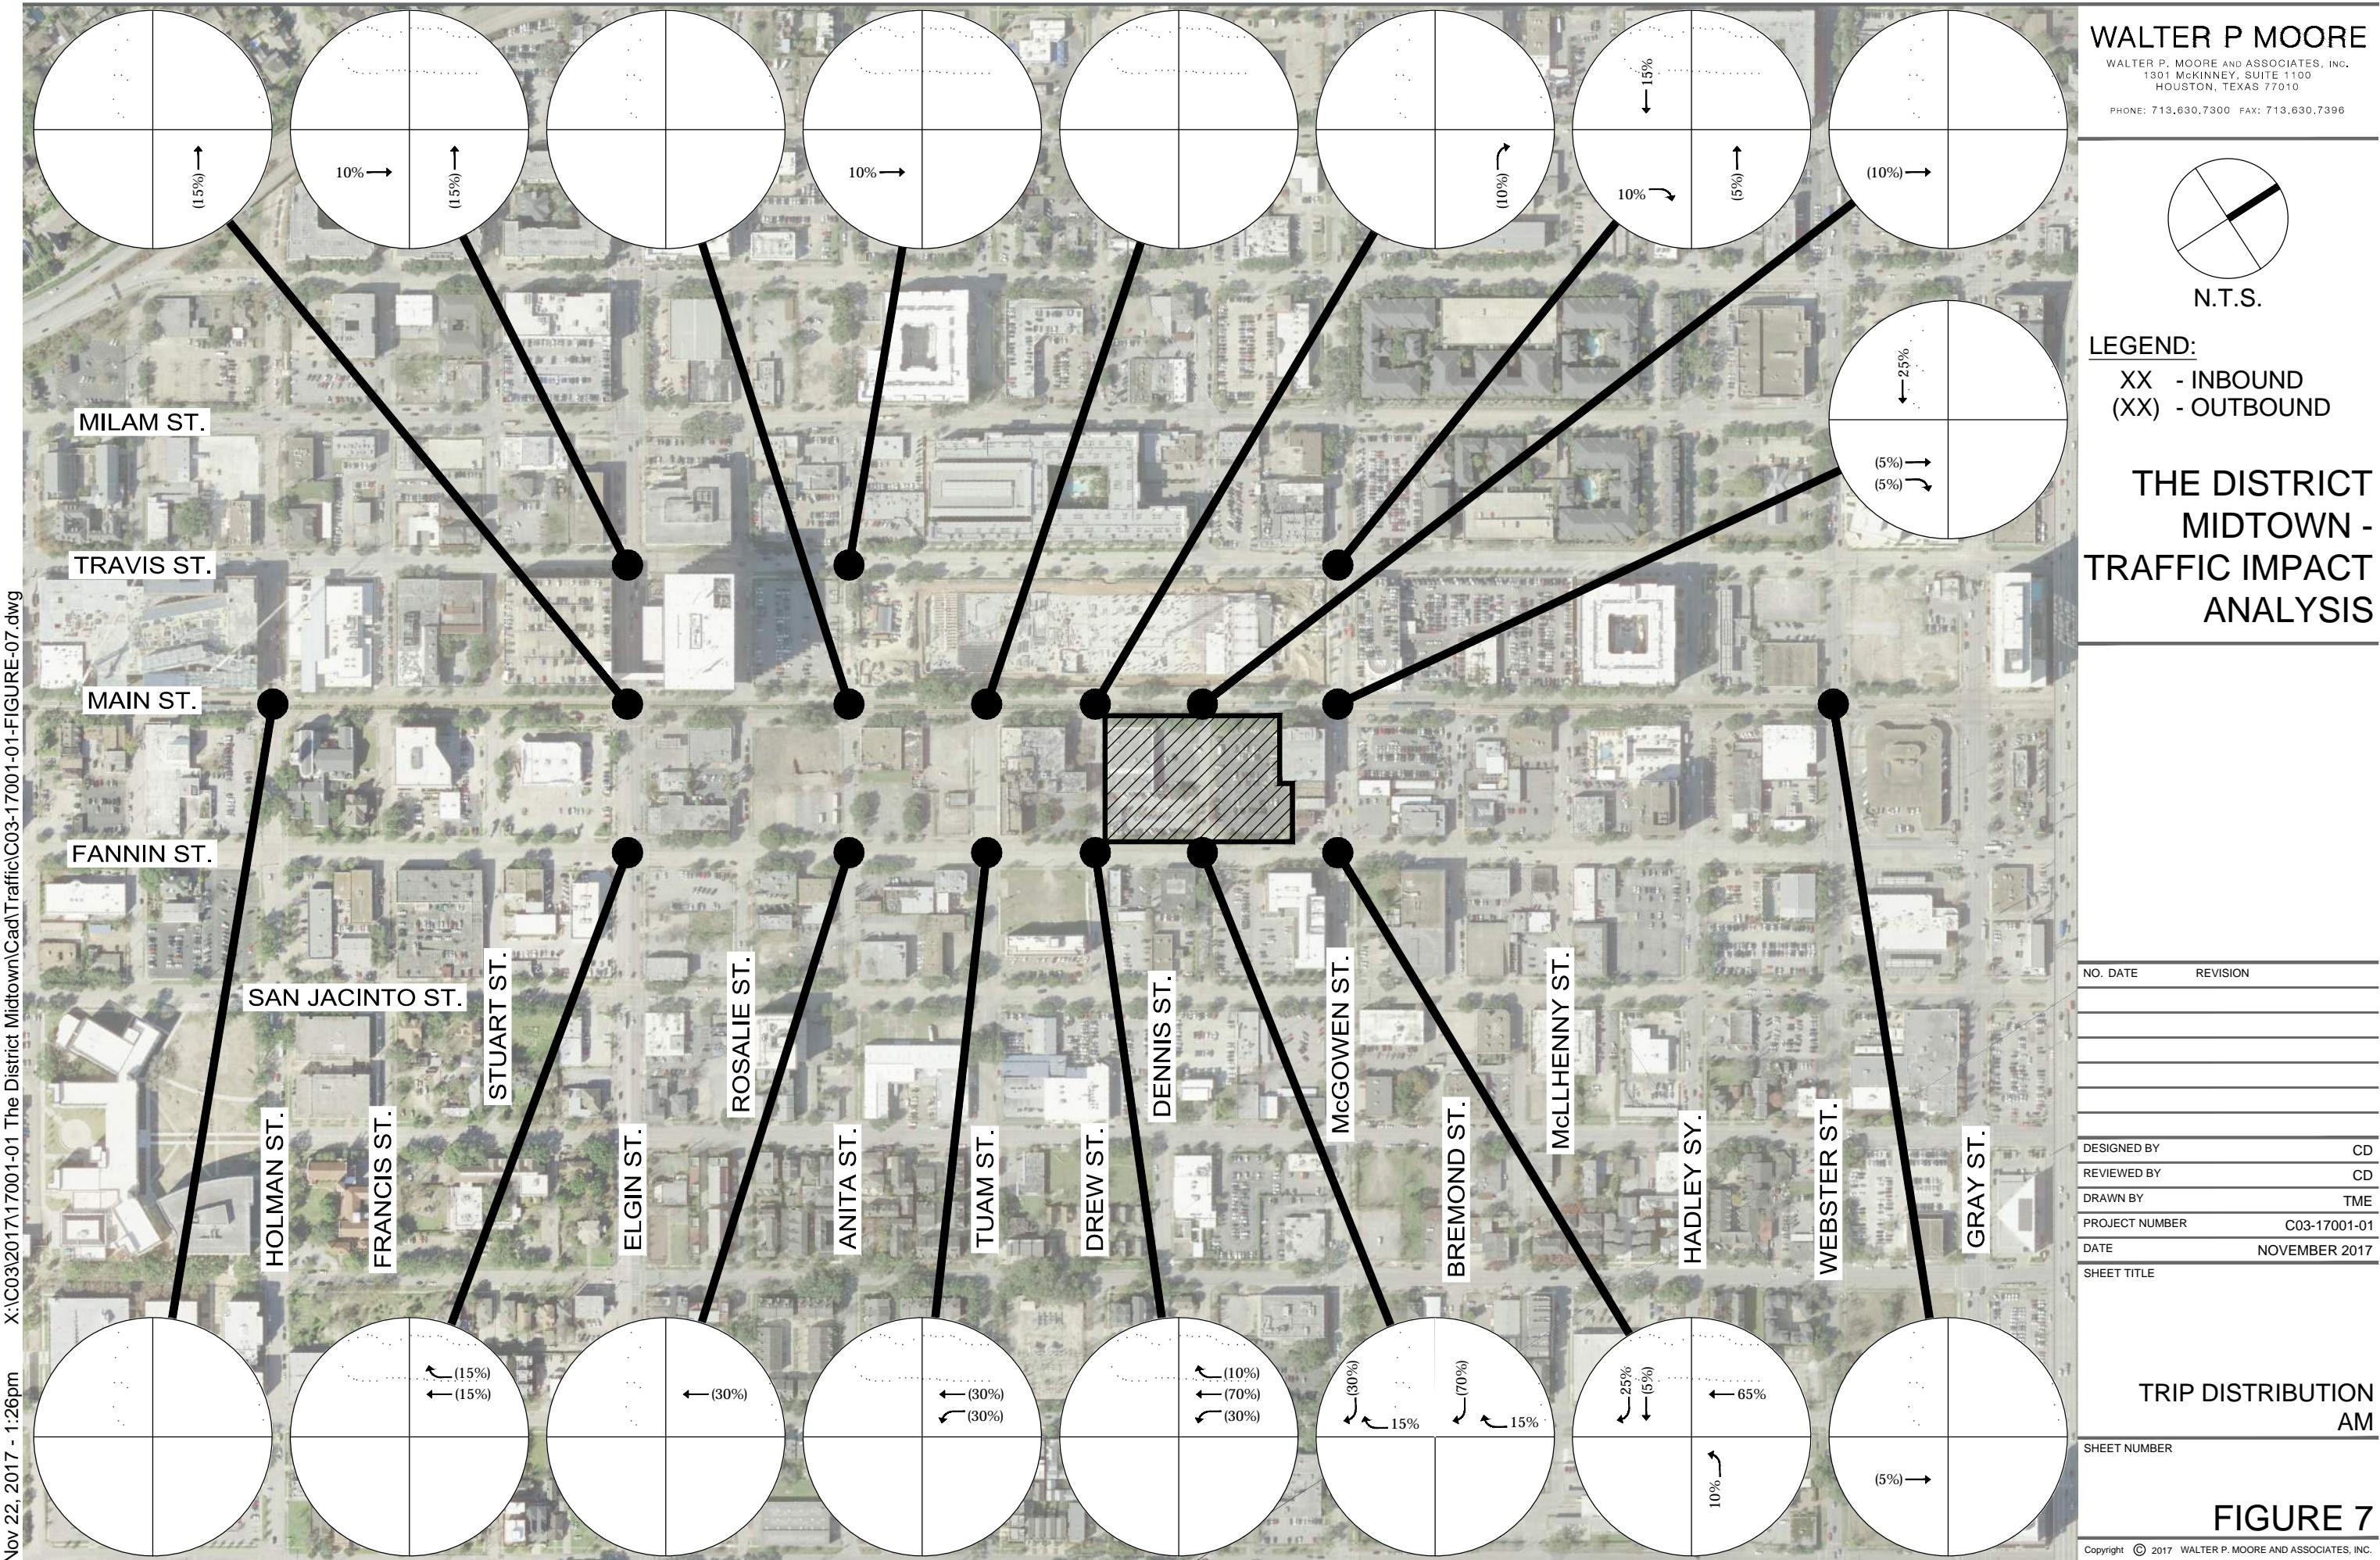

In order to assign the generated traffic of this mixed-used development to the respective driveway, the volumes of different land uses assigned to each driveway were quantified. Driveway C, will only provide access to the residents of the apartments, as well as to the restaurant valet parking, which for this study is estimated to be 20% (based on the developer estimations) of the trips generated by the restaurants in the development. Driveway B, will provide access to the rest of the land uses.

Table 2 shows the total volume of trips on each driveway, and the represented percentage with respect to the total trips generated during the peak hours by driveway.

Table 5: Driveway Utilization by User

Driveway	Driveway B				Driveway C			
Land Use Driveway Users	Health, Fitness Club, Supermarket, Hotel, City Park, Restaurant self-parking				Apartments, Restaurant Valet Parking			
Peak	AM Peak		PM Peak		AM Peak		PM Peak	
	Enter	Exit	Enter	Exit	Enter	Exit	Enter	Exit
Land Use Traffic Volumes	283	97	311	351	45	211	255	132
Percentage Based on Total Volume	86%	31%	55%	73%	14%	69%	45%	27%

Using the trip generation volumes and the trip distribution explained above, **Figures 9 and 10** illustrate the number of trips generated by the development for the AM and PM peak hours respectively.

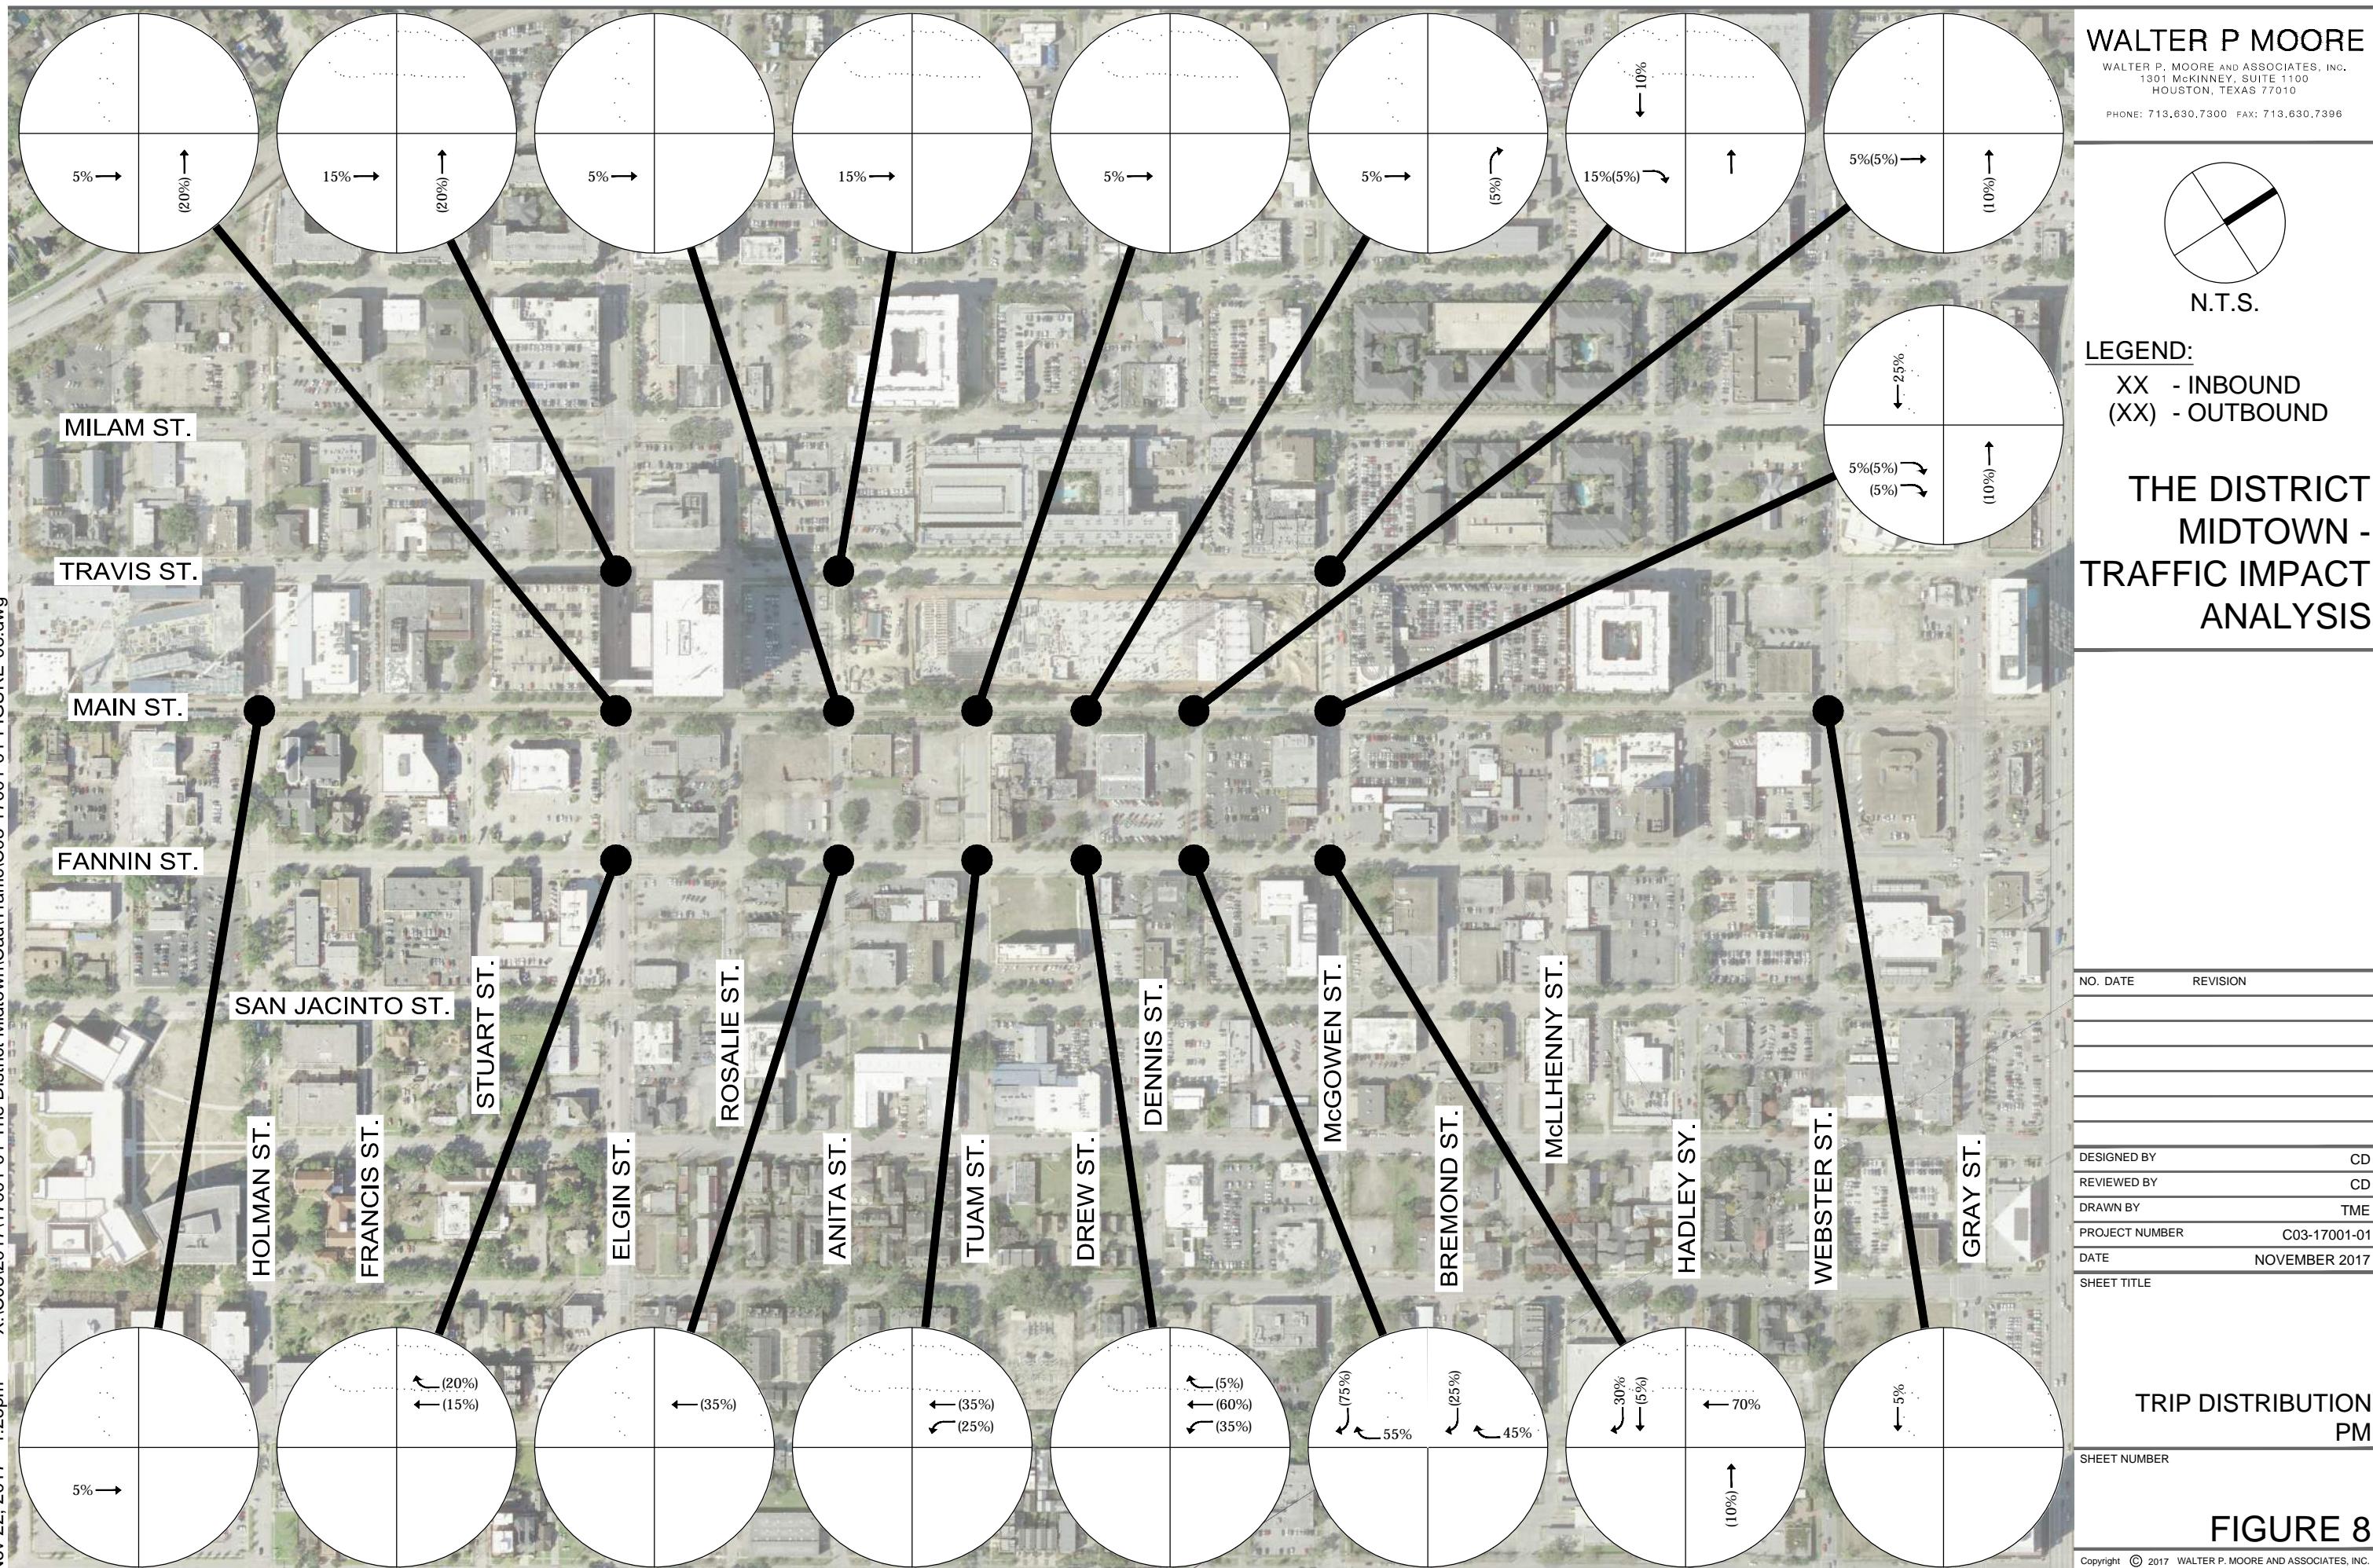

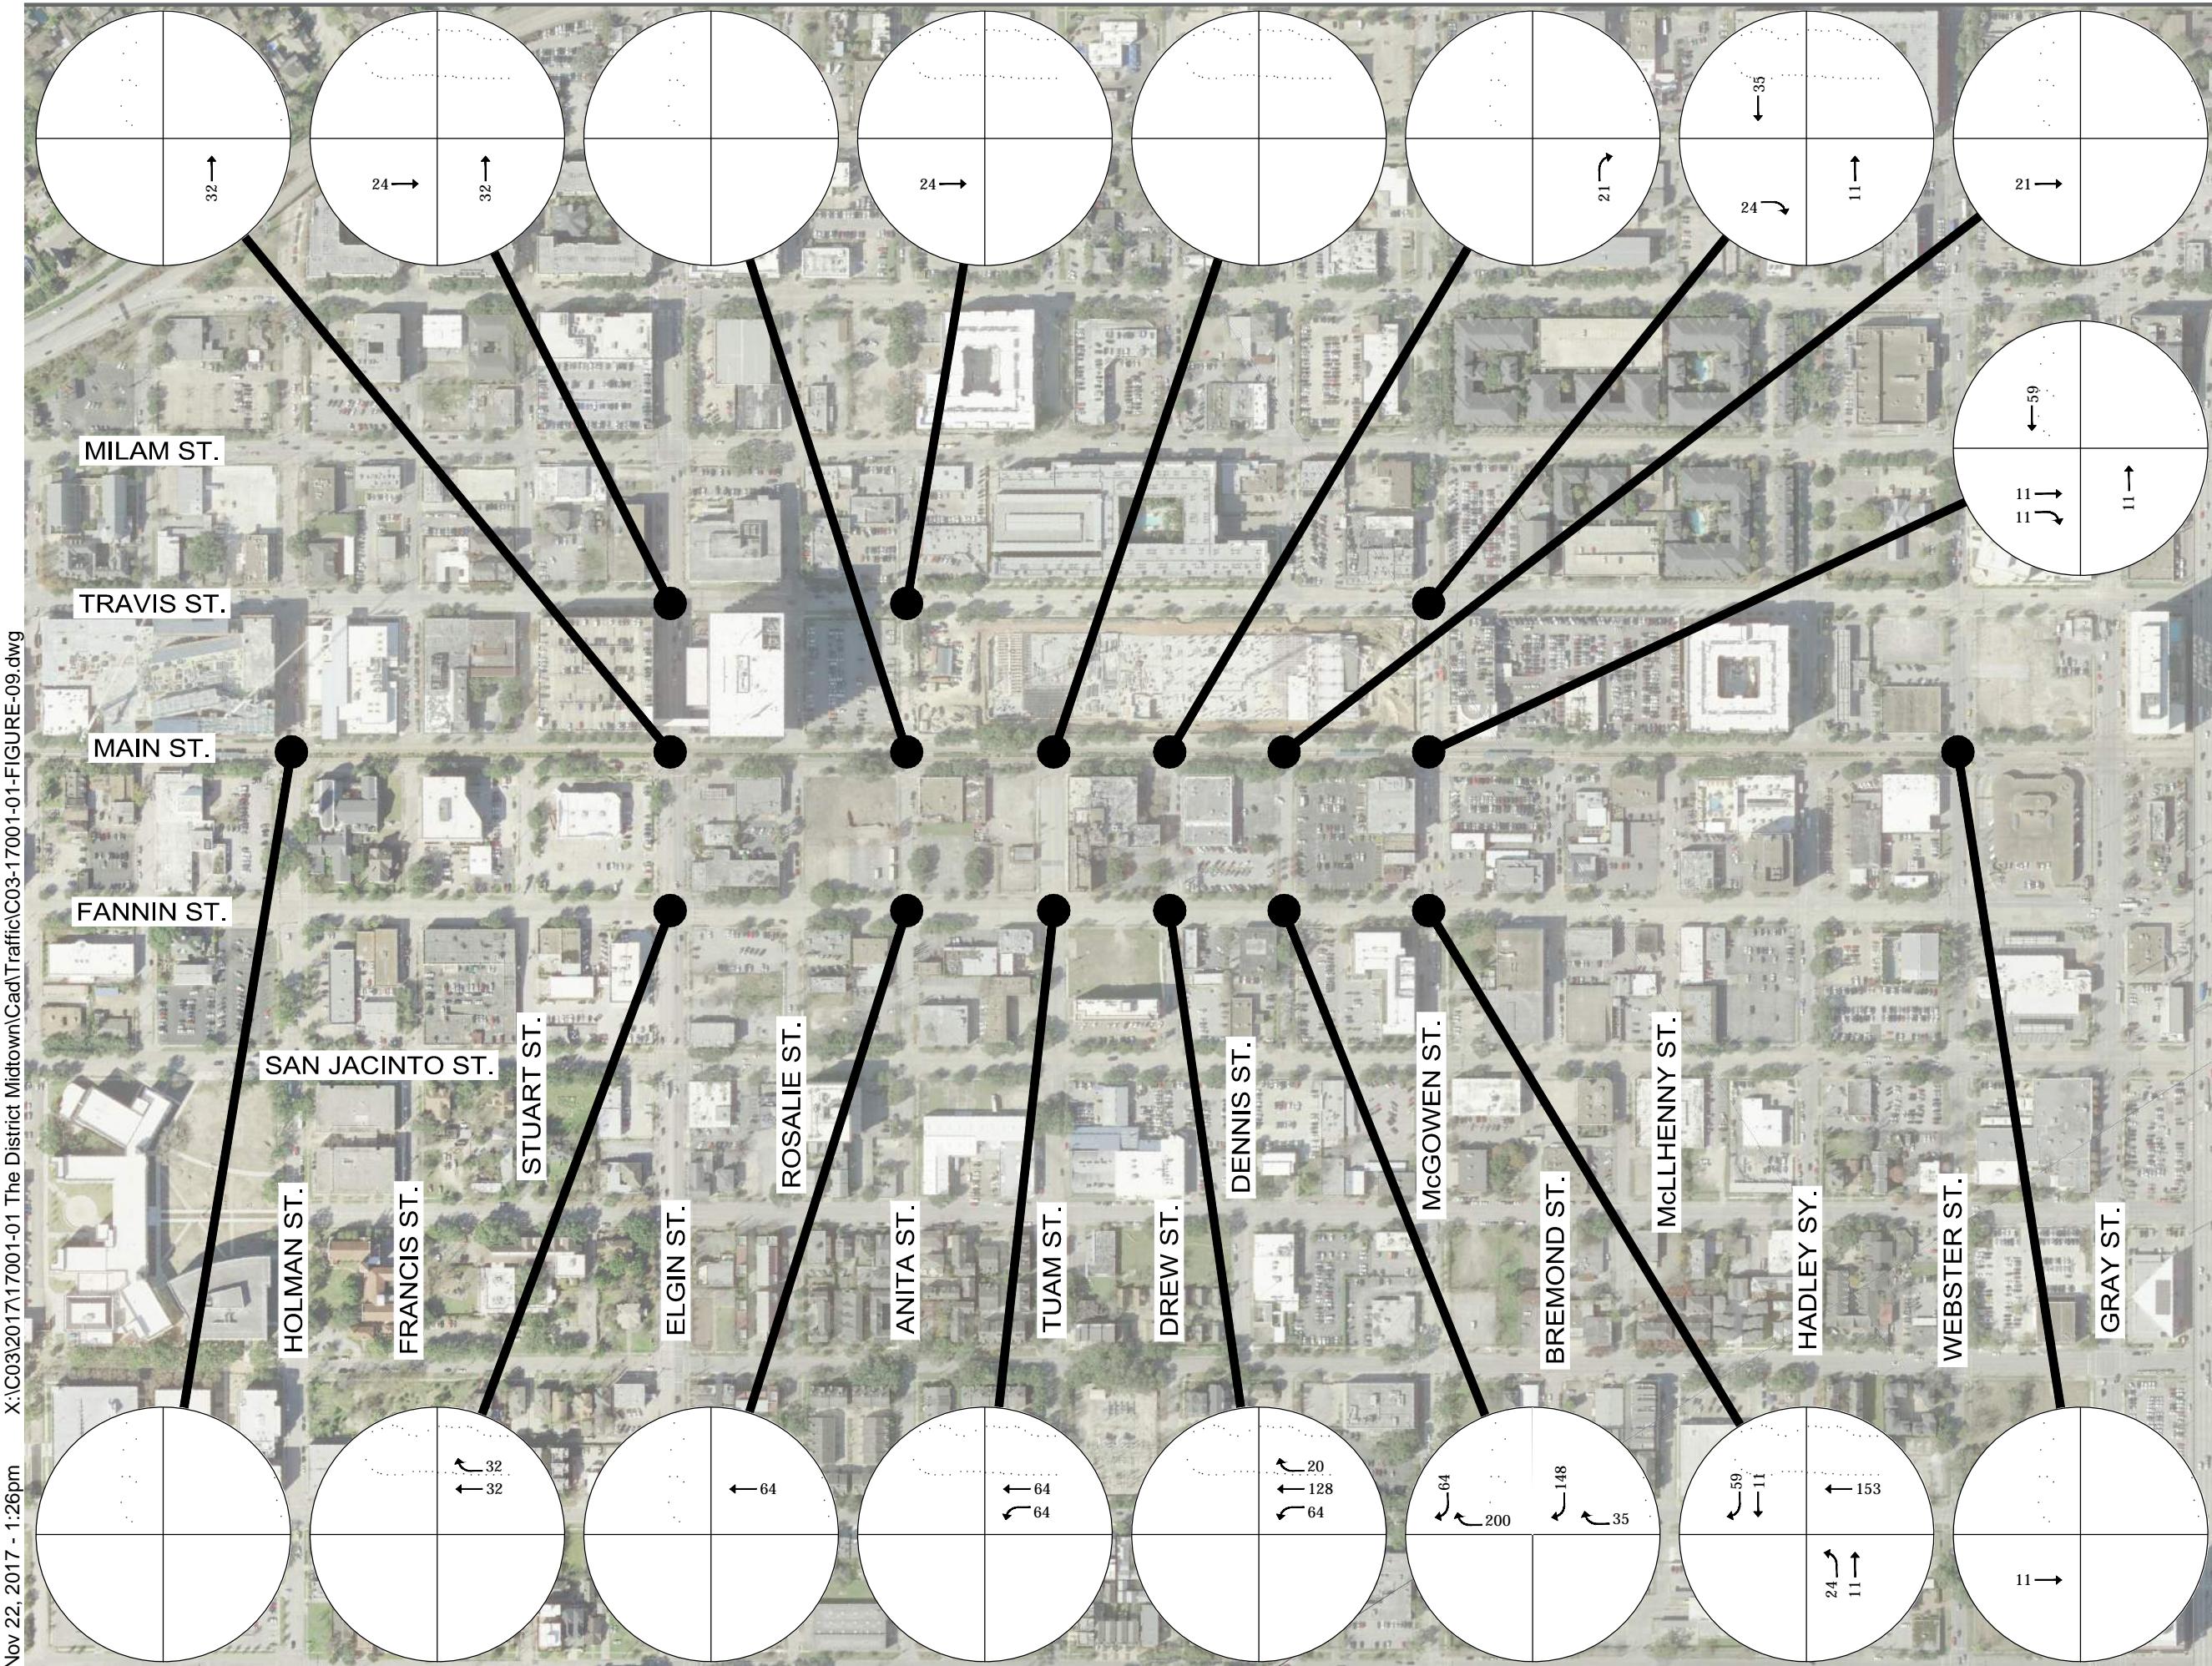

FIGURE 8

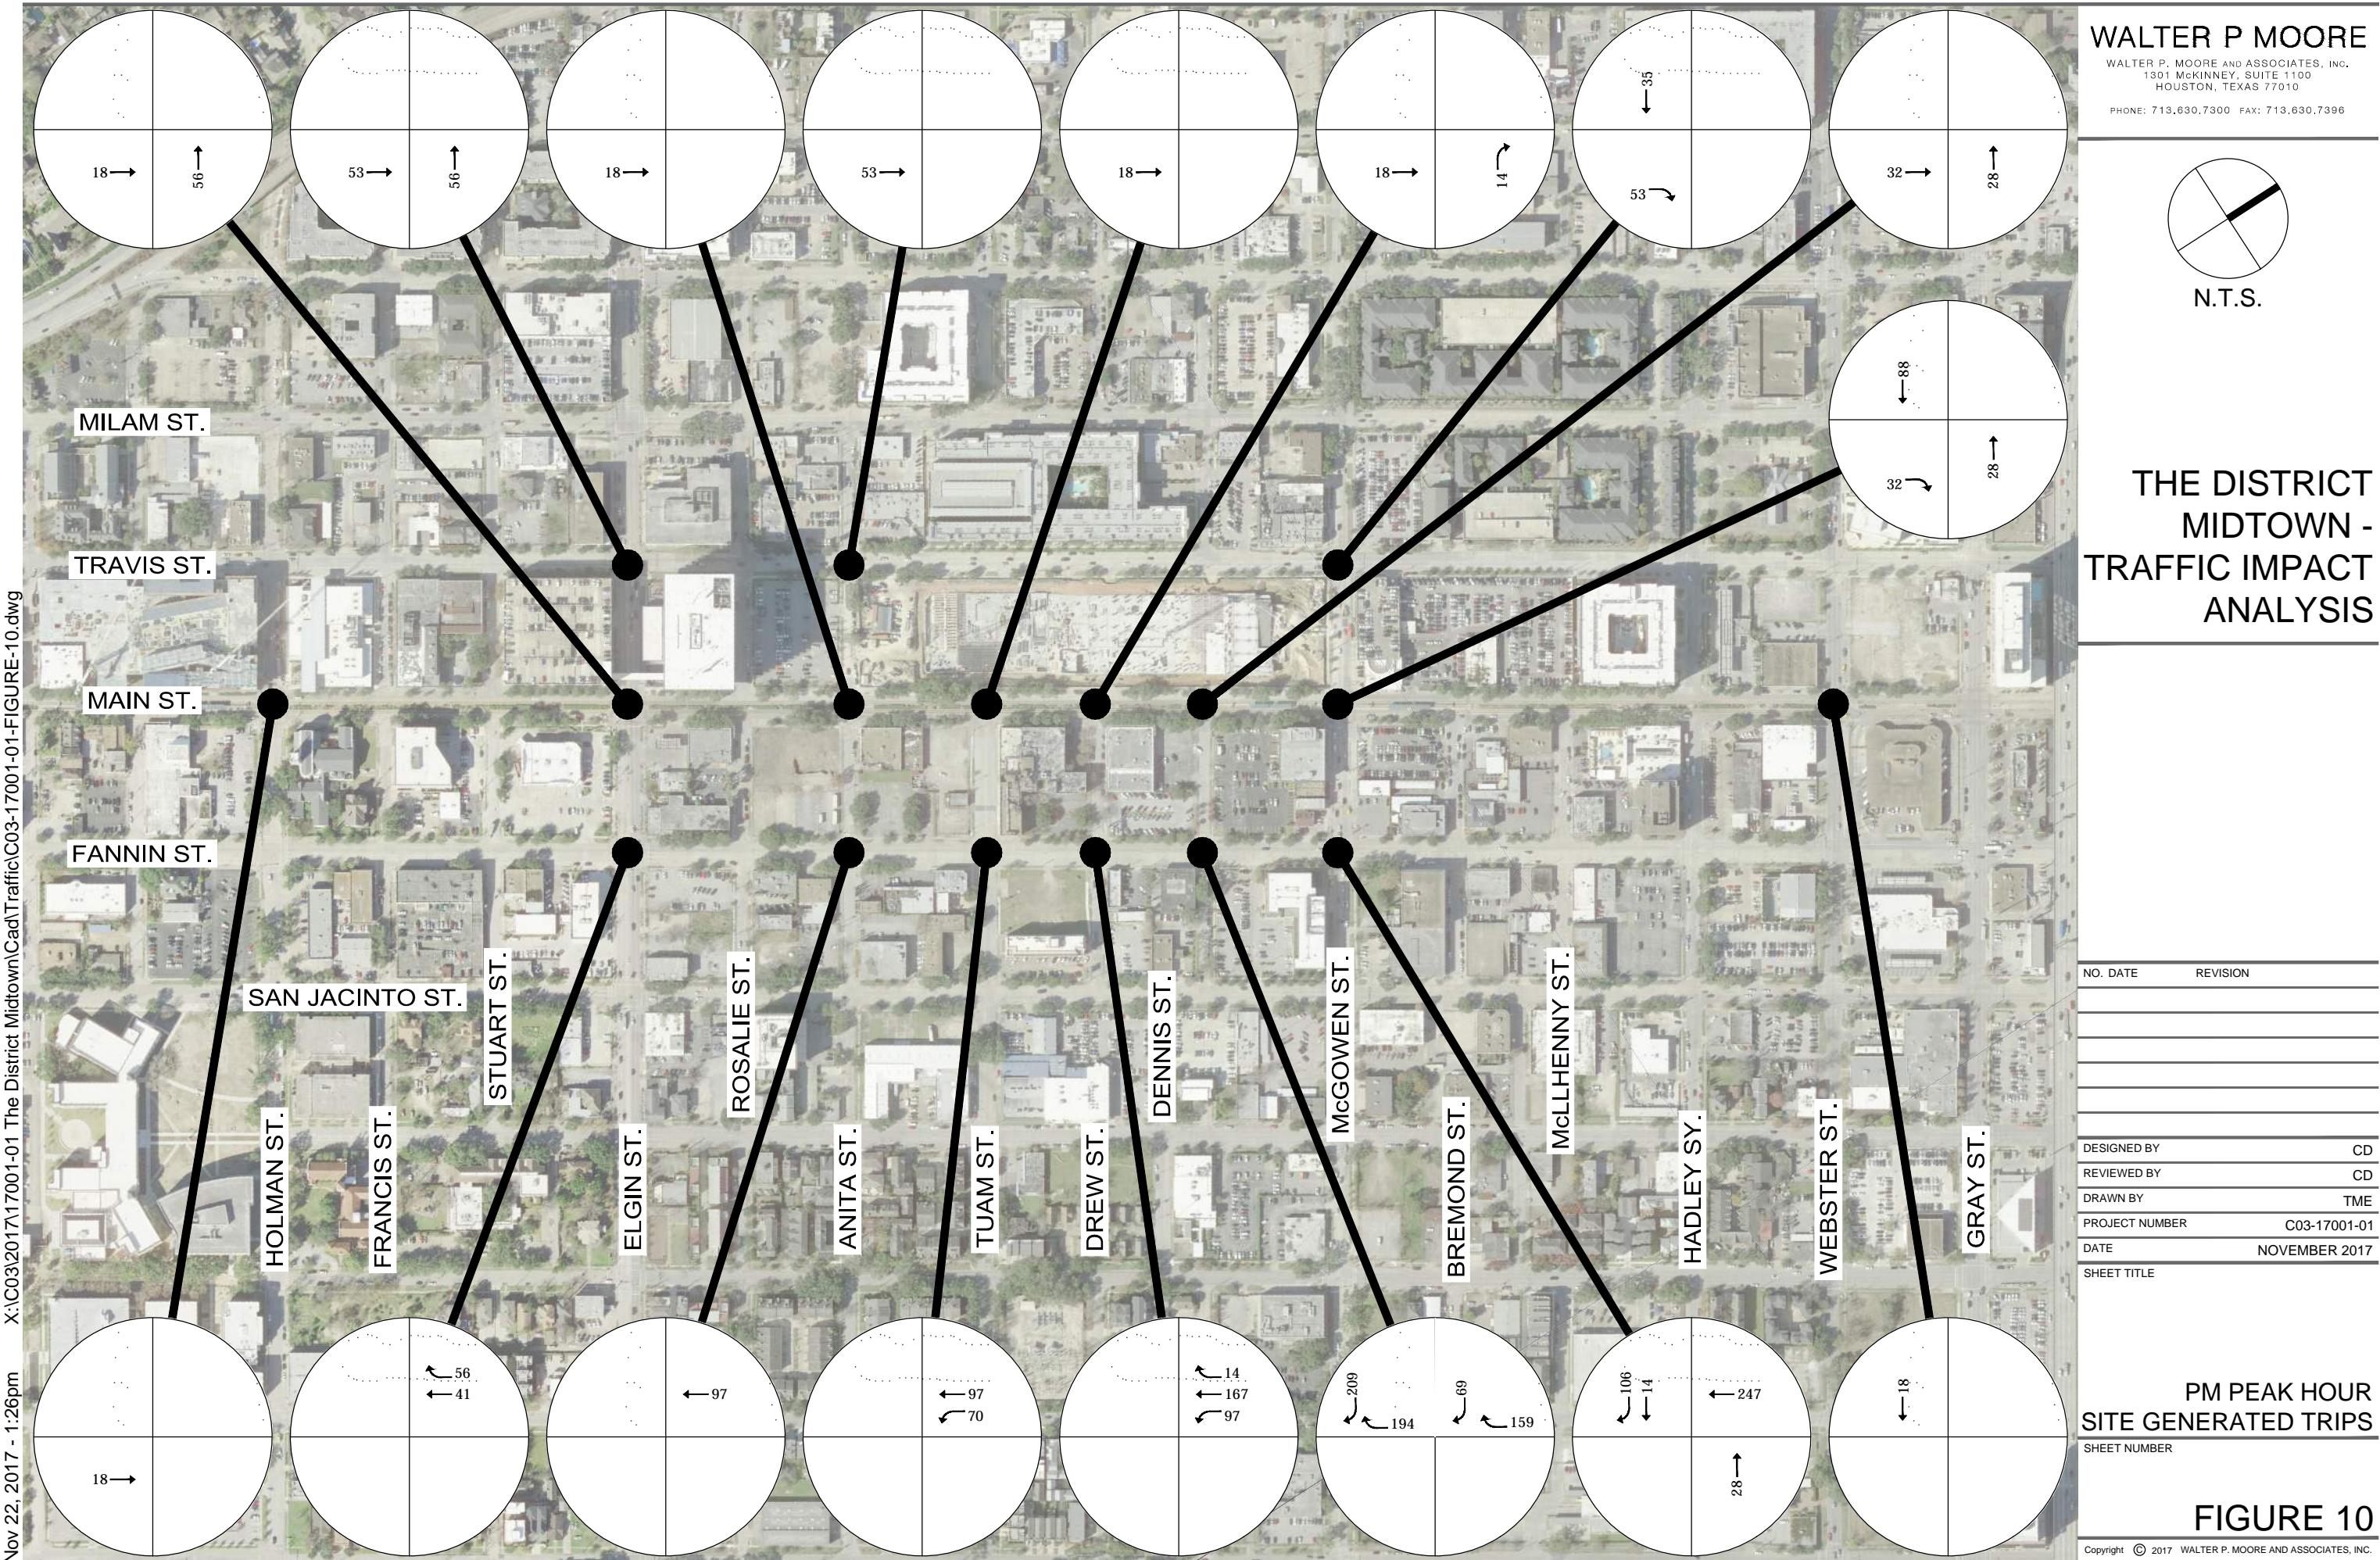

FIGURE 10

TRAFFIC ANALYSIS

Capacity analyses were performed for existing (2017), background (2021), and proposed (2021 plus trip generated) conditions after developing the projected turning movement volumes for the peak hours. The roadway network and traffic patterns were analyzed using *VISSIM 9.0*.

AM and PM peak traffic signal timings from the City of Houston were used in the analyses, including the LRT operations. The results of the existing, background, and proposed conditions analysis were compared to determine the impact of the proposed development on the analyzed intersections.

Results of the capacity analysis are reported in standard level of service format, with the most favorable conditions being designated as LOS A and the poorest conditions indicated by LOS F. Intersection level of service (LOS) is based on the amount of delay that each vehicle encounters at a given intersection.

Transportation agencies generally consider operations at or above LOS C to be acceptable. In more dense urban areas, operations at or above LOS D may also be considered acceptable during peak traffic hours. Overall, LOS E or F is unacceptable.

For unsignalized intersections, the intersection level of service is defined by the stop controlled movement with the highest delay. The level of service criteria for unsignalized and signalized intersections, along with a brief description of the conditions experienced for each level of service grade can be seen in **Table 5** and **Table 6**, respectively.

Table 6: Level of Service Criteria for Unsignalized Intersections

Level of Service	Avg. Total Delay (seconds/vehicle)	Description
A	≤ 10	At most, one vehicle is waiting to move through the intersection when the driver reaches the stop sign. Most often, the driver pulls up to the stop sign and is immediately free to proceed through the intersection.
B	> 10 and ≤ 15	When the driver reaches the intersection, one or two vehicles are in front of him. Once those vehicles proceed through the intersection, the driver is able to continue without opposition.
C	> 15 and ≤ 25	At this level, several vehicles may be in front of the driver at a two-way stop-controlled intersection. At an all-way stop-controlled intersection, there may be two or more vehicles at each approach that the driver has to wait for before getting his turn.
D	> 25 and ≤ 35	At this level, there are at least four vehicles in front of the driver and several vehicles at the other approaches. Also, for two-way stop-controlled conditions, the volume of traffic on the uncontrolled Street may be high.
E	> 35 and ≤ 50	When the driver reaches the intersection, there are between five and eight vehicles in front of him and many vehicles at the other approaches that must also proceed through the intersection before the driver may continue.
F	> 50	At this level, the driver must wait for eight to ten cars at his approach to move through the intersection along with at least five vehicles at the other approaches. This level can also occur at two-way stop-controlled intersections when the uncontrolled Street has such a high volume that no gaps are available in the traffic stream for the vehicles at the cross Street to continue.

Table 7: Level of Service Criteria for Signalized Intersections

Level of Service	Stopped Delay (seconds/vehicle)	Description
A	≤ 10	At a single intersection most vehicles do not stop at all. When linked with other signals, vehicles progress through intersections without stopping.
B	> 10 and ≤ 20	At a single intersection some vehicles stop before getting a green signal. When linked with other signals, some cars may have to stop but most progress through the intersection without stopping.
C	> 20 and ≤ 35	At a single intersection, a significant number of vehicles must stop and wait for a green signal. Some vehicles may have to wait through one full signal cycle before being able to move through the intersection.
D	> 35 and ≤ 55	At this level, congestion is noticeable. Many vehicles have to stop while waiting for a green signal. A noticeable number of vehicles have to wait through one full cycle before being able to continue through the intersection.
E	> 55 and ≤ 80	At this level, almost all vehicles have to wait through one or more full signal cycles before moving through the intersection. When linked with other signals, progression is slow.
F	> 80	At this level, the number of vehicles entering the intersection exceeds its capacity. Vehicles have to wait through multiple full signal cycles before moving through the intersection.

EXISTING CONDITIONS

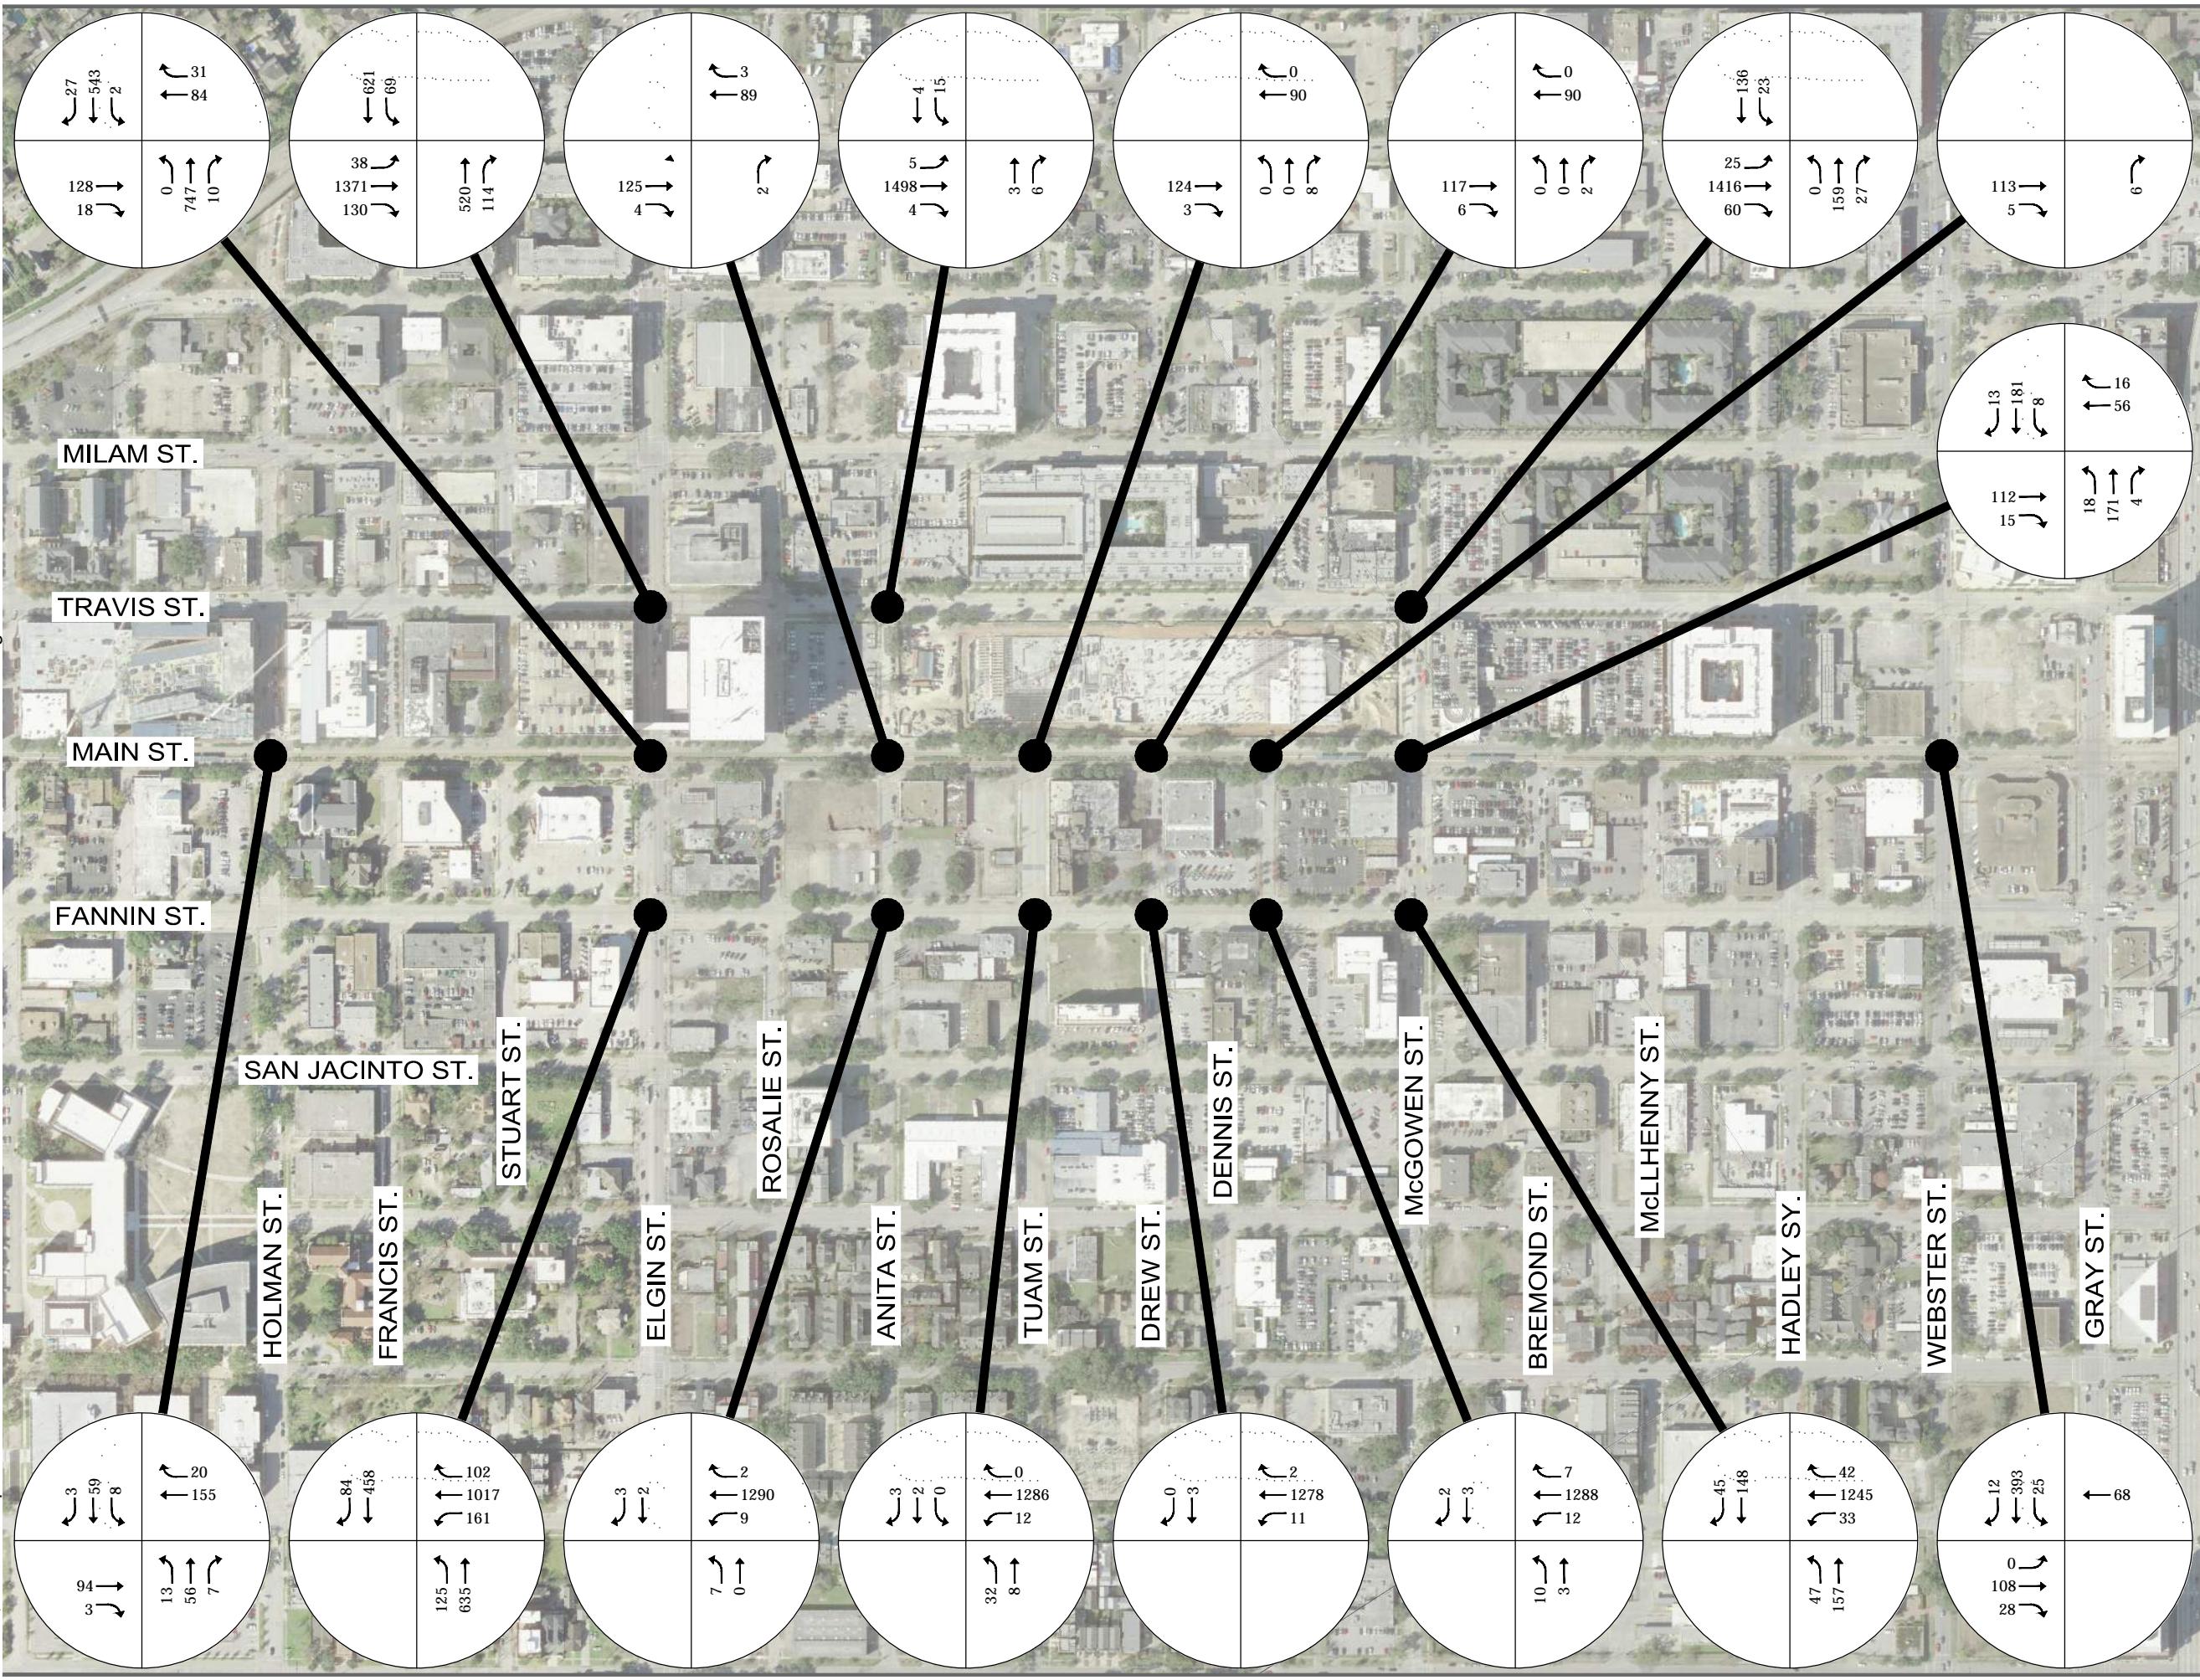

For the analysis of existing conditions, existing traffic count data and traffic signal timings from City of Houston were used. Traffic volumes for existing AM peak hour and PM peak hour conditions are shown in **Figures 3** and **4**. Existing conditions capacity analyses can be found under **TAB Two**.

BACKGROUND CONDITIONS

For the analysis of background conditions, traffic volumes for 2021 were used. Based on conversations with the City of Houston staff representatives, the existing counts were grown using a 1.0 % annual growth rate for the entire road network in the study area. Traffic volumes for background AM peak hour and PM peak hour conditions are shown in **Figures 11** and **12**. Background conditions capacity analyses can be found under **TAB THREE**.

PROPOSED CONDITIONS

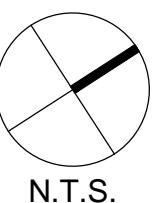

For the analysis of the proposed conditions, background traffic volumes for 2021, with the added proposed traffic generated by the development were simulated. Dennis Street, from Main Street to Fannin Street, was removed from the network. All traffic using Dennis Street was reassigned to use

Drew Street. It is important to highlight that Dennis Street has very little traffic during both of the studied peak hours.

The driveways for the main public parking lot and the residential parking lot were simulated utilizing a proposed 190-foot deceleration lane. The traffic generated by the development was assigned to their respective driveways. The analysis of the driveway utilization shown in **Table 2** was used as the base for the driveway designation coded in the VISSIM model. **Table 8** shows the percentage of traffic for the outbound and inbound of the traffic generated by the development during both peak hours.

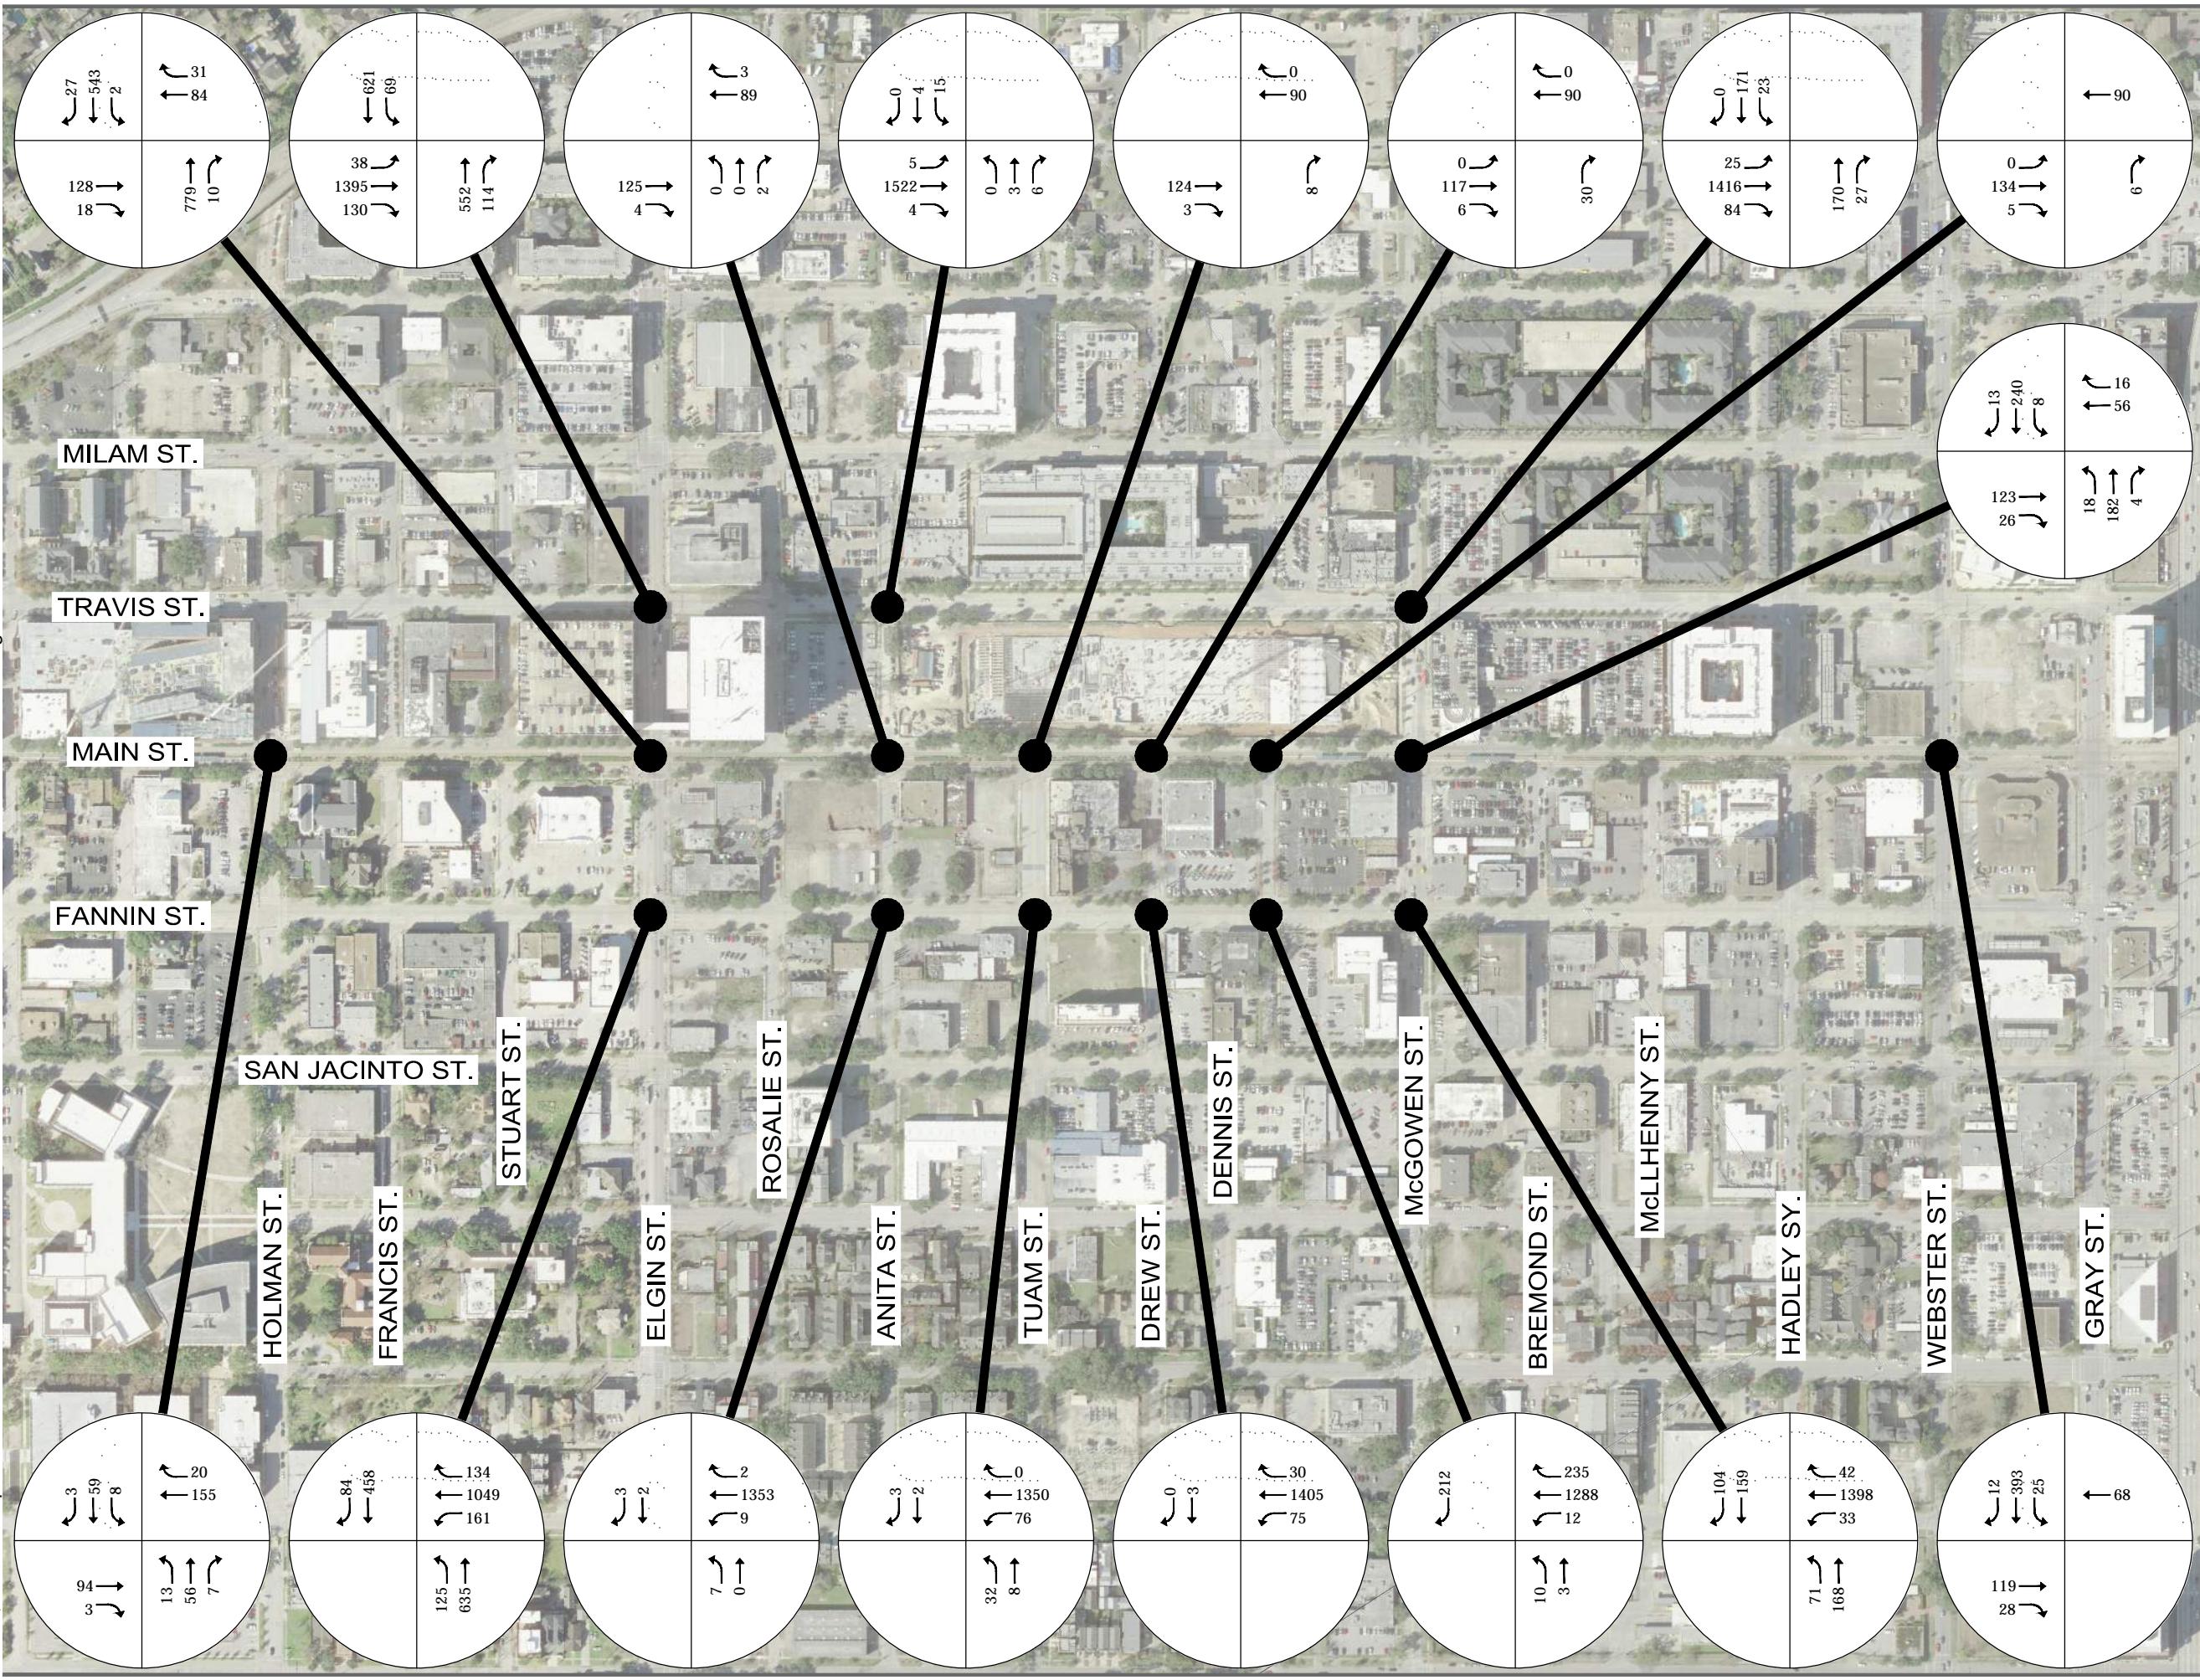

Table 8: Driveway Designation

Driveway	Driveway B		Driveway C	
Parking Assignment	Health, Fitness Club, Supermarket, Hotel, City Park, Restaurants Self-Parking		Apartments, Restaurant Valet Parking	
Route	Outbound	Inbound	Outbound	Inbound
AM	30%	85%	70%	15%
PM	75%	55%	25%	45%

Traffic volumes for proposed AM peak hour and PM peak hour conditions are shown in **Figures 13** and **Figure14**. Proposed conditions capacity analyses can be found under **TAB FOUR**.

LEVEL OF SERVICE COMPARISON

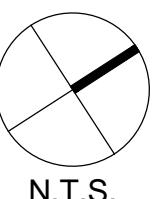

A comparison of the AM and PM peak hour scenarios can be found in **Table 9** and **Table 10**, respectively.

KEY FINDINGS AND RECOMMENDATIONS

The projected traffic generated by the proposed development in Midtown will have a limited impact to the existing traffic. The anticipated traffic generated by the development will not decrease the LOS of the surrounding study area intersections. Fannin Street, where all of the proposed driveways of the development will be located, has adequate capacity to handle the additional traffic generated by the proposed site.

The removal of the Dennis Street shows a minimal impact to traffic in the area. The traffic volumes for both AM and PM peak hours are low (15 vehicles for the AM peak and 16 vehicles for the PM peak) and the adjacent Streets, Drew Street and McGowen Street, were able to accommodate the rerouted traffic.

The simulation also showed that the proposed deceleration lane was able to provide adequate storage for traffic entering into the development. The VISSIM model also showed that the traffic signal at the intersection of Fannin Street at McGowen Street, provided adequate gaps for traffic leaving the proposed site.

CONCLUSIONS

Based on the traffic capacity analysis, the District-Midtown development is not anticipated to have a major impact on the surrounding intersections analyzed in this report.

By using the ITE Trip Generation Handbook, it was estimated that the total number of trips generated by the development will be 492 trips in the AM peak hour, and 632 trips in the PM peak hour. These trips will access the development using the two main driveways located along Fannin Street. A third driveway will serve as a loading dock area. The VISSIM simulation shows that the anticipated traffic generated by the development will not decrease the LOS at the analyzed intersections in this study.

Fannin Street, where all the proposed driveways of the development will be located, has enough capacity to handle the additional generated traffic. The removal of Dennis Street due to the proposed development does not have a significant impact to the traffic in the area. Traffic count volumes for both AM and PM peak hours show high traffic volumes utilizing Dennis Street, and that the adjacent Drew Street and McGowen Street were able to accommodate the rerouted traffic.
